## Software description Modbus RTU

## CONNECT

## Summary

## Description of the standard software of the Modbus RTU modules:

General commands ..... 3
MR-DO4 / MR-DOA4 ..... 6
MR-TO4 ..... 10
MR-DI4 / MR-DI4-IP ..... 14
MR-DI10 ..... 15
MR-SI4 ..... 16
MR-DIO4/2 / MR-DIO4/2S MR-DIO4/2-IP ..... 21
MR-TP ..... 31
MR-AO4 ..... 39
MR-AOP4 ..... 41
MR-AI8 ..... 43
MR-CI4 ..... 51
MR-AIO4/2-IP ..... 52
MR-SM3 ..... 69
MR-Multi I/O 12DI/7AI/2AO/8DO ..... 76
MR-LD6 ..... 91

## General commands

## Bit rate setting with Modbus commands

Parity and bit rate have the same value as with the setting by the address switches.
If Parity or bit rate are 0 , there will be no setting or storage.
The register content is stored in the EEPROM.

Modbus Function "06 (0x06) Write Single Register"
Modbus Function "16 (0x10) Write Multiple Registers"

## Request

Valid Register Address 0x41 (65)
Valid Register Value 2 Bytes

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0x53 |  |  |  |  |  |  |  |  | Parity |  |  |  | Bit rate |  |  |

Bit 15-8: Magic-Number $0 \times 53=83$ as protection against accidental writing. The command will be further analyzed only with this number.

| Bit 7-4 | 1 | 2 | 3 |
| :---: | :---: | :---: | :---: |
| Parity | even | odd | none |

| Bit 3-0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit rate | 1200 | 2400 | 4800 | 9600 | 19200 | 38400 | 57600 | 115200 |

## Response

Echo of Request

## Example for a frame:

| Slave address | $0 \times 12$ | Rotary switch setting (18) |
| :--- | :--- | :--- |
| Function | $0 \times 06$ | Write Single Register |
| Register address Hi | $0 \times 00$ |  |
| Register address Lo | $0 \times 41$ | Bit rate and Parity (65) |
| Register content Hi | $0 \times 53$ | Magic number |
| Register content Lo | $0 \times 15$ | Parity Even, 19200 Bit/s |

All devices can be switched simultaneously with a Broadcast command (Slave address 0x00) However, it is advised not to do so as this may cause problems:

- Devices from other manufacturers may have under this address a register for a different purpose that will then be operated in the wrong way.
There is no feedback from the individual devices. Consequently the control cannot immediately recognize if the command was correctly received.

It is safer to address and switch each device individually. The device will then answer with the old settings of parity and bit rate. Switching will take place afterwards. However, the answer can get lost if the bus is disturbed.
When all devices are switched; it is advised to check communication. Any function of the device providing a feedback is suitable. If a single function is to be used being independent from the process periphery then the function "Diagnostic" sub-function "Return Query Data" is suitable, it returns the transferred data.

If bit rate and parity setting of a device are unknown it is possible to address the device successively with all combinations of bit rate and parity until the device answers. Try the most likely combinations first. Try the lower bit rates last as they take longer.

## Test of the communication system <br> Modbus Function "08 (0x08) Diagnostics" <br> Subfunction "0 (0x0000) Return Query Data" <br> Data Field Any <br> Response: Echo of Request

Subfunction "1 (0x0001) Restart Communication Option"<br>Data Field 0x0000 or 0xFF00<br>Response: Echo of Request<br>Action: Clears all Error Counters, Restarts node<br>Subfunction "4 (0x0004) Force Listen Only Mode"<br>Data Field 0x0000<br>No Response<br>Action: No response until Node Reset or Function Code 08<br>Subcode 01

Subfunction "10 (0x000A) Clear Counters"
Data Field 0x0000
Response: Echo of Request
Action: Clears all Error Counters
Subfunction "11 (0x000B) Return Bus Message Count"
Data Field 0x0000
Response: Quantity of messages that the remote device has detected on the communications system since its last restart, clear counters operation, or power-up.
Subfunction "12 (0x000C) Return Bus Communication Error Count"
Data Field 0x0000
Response: Quantity of errors encountered by the remote device since its last restart, clear counters operation, or power-up. (CRC, Length <3, Parity, Framing

## Subfunction "13 (0x000D) Return Bus Exception Error Count"

Data Field 0x0000
Response: Quantity of Modbus exception responses returned by the remote device since its last restart, clear counters operation, or power-up.

## Subfunction " 14 (0x000E) Return Slave Message Count"

Data Field $0 \times 0000$
Response: quantity of messages addressed to the remote device, or broadcast, that the remote device has processed since its last restart, clear counters operation, or power-up.

```
Subfunction "15 (0x000F) Return Slave No Response Count"
Data Field 0x0000
Response: Quantity of messages addressed to the remote device for which it has returned no response (neither a normal response nor an exception response), since its last restart, clear counters operation, or power-up.
```

## MR-DO4 / MR-DOA4

## Counter functions

The following functions are used to read or write the registers. The valid address ranges are indicated in brackets.
"04 (0x04) Read Input Registers" (0-20)
"03 (0x03) Read Holding Registers" (0-43)
"06 (0x06) Write Single Register" (20-43)
"06 (0x06) Write Single Register" (65)
"16 (0x10) Write Multiple Registers (0-43, 65)
For long data types with a length of several registers, these registers are listed directly one after the other and the one with the highest value is indicated first. This data can only be transmitted as complete set.

| Input Register (Read-Only) |  |  |
| :--- | :--- | :--- |
| Address | Name | Description |
| $0-11$ | IZ | Pulse counter <br> Data type uint48_t (3 registers each) |
| $12-19$ | BZ | Calculated counter reading <br> Data type uint32_t (2 registers each) |
| 20 | INPUT | Bits 0-3 include Discrete Input 0-3 |

| Holding Register |  |  |
| :---: | :---: | :---: |
| Address | Name | Description |
| 0-11 | IT | Copy of the pulse counter after having pressed the key Data type uint48_t (3 registers each) (EEPROM) |
| 12-19 | AZ | Initial counter reading <br> Data type uint32_t (2 registers each) <br> Factory setting 0 (EEPROM) |
| 20-23 | IE | Pulses per unit Data type uint16_t (1 register each) Factory setting 1 (EEPROM) |
| 24-27 | WI | Transformation factor for current Data type uint16_t (1 register each) Factory setting 1 (EEPROM) |
| 28-31 | WU | Transformation factor for voltage Data type uint16_t (1 register each) Factory setting 1 (EEPROM) |
| 32-35 | WP | Operating mode for calculation with transformation factor Data type uint16_t (1 register each, only Bit 0 is valid) <br> Value range $0 . . .1$, see below <br> Factory setting 0 (EEPROM) |
| 36-39 | ZS | Format of the counter digit display <br> Data type uint16_t (1 register each) (EEPROM) <br> High-Byte for counter digits, <br> Value range $0 . . .9$, factory setting 7, <br> higher values are limited to 9 . <br> Low-Byte for places after the decimal point, <br> Value range $0 . . .3$, factory setting 1 , higher values are limited to 3 . |
| 40-43 | TA | Flag for key activation Data type uint16_t (1 register each, only Flag in Bit 0) 0 : key is blocked, 1 : key is operational Factory setting 1 (EEPROM) |
| 65 | Bit rate | Codes for bit rate and Parity Factory setting 19200 bit/s, Even Parity (EEPROM) |

## Operating mode for calculation with transformation factor

In the WP register, there is a code $0 \ldots 1$ that determines, together with the transformation factors WI and WU, the way how they are included in calculation. WP, WI and WU depend on whether the transformers are switched by the counters, whether the counter indicates the consumption in a primary or secondary way and whether the emitted pulses correspond primarily or secondarily to the consumption.

A difference must be made between the following electricity meter types:
Type 1: Directly measuring counter, display: primary, pulse: primary
Note: Indicates the real consumption
Species:
DIN rail counter with mechanical drum-type counting mechanism, Ferraris counter
Formula type:
WP = 0
Factors:
$W I=W U=1$
IZ - IT
$B Z=(--------+A Z) \cdot W I \cdot W U, B Z=$ counter reading $=$ consumption
IE
Type 2: Transformer counter, display: primary, pulse: secondary
Note: Indicates the real consumption
Species: counter with LCD display
Formula type: $\quad W P=1$
Factors: WI and WU correspond to the transformers

```
IZ - IT
\(B Z=(---------\cdot W I \cdot W U)+A Z, B Z=\) counter reading \(=\) consumption
IE
```

Type 3: Transformer counter, display: primary, pulse: primary
Note: Indicates the real consumption
Species: counter with LCD display, multi-function counters
Formula type: $\quad W P=0$
Factors: $\quad \mathrm{WI}=\mathrm{WU}=1$
$B Z=\left(--------\frac{I Z-I T}{I E}+\mathrm{AZ}\right) \cdot \mathrm{WI} \cdot \mathrm{WU}, \mathrm{BZ}=$ counter reading $=$ consumption
Type 4: Transformer counter, display: secondary, pulse: secondary Note:

Indicates the consumption reduced by the transformation factors
Species: DIN rail counter with mechanical drum-type counting mechanism, Ferraris counter
Formula type: $\quad$ WP $=0$

Consumption and display of the transformer counter are different. Both can be calculated using a different configuration (WI, WU).
Factors: $\quad W I=W U=1$ :
The calculated counter reading corresponds to the display of the transformer counter.
Species:
DIN rail counter with mechanical drum-type counting mechanism, Ferraris counter.

```
    IZ - IT
\(B Z=(---------+A Z) \cdot W I \cdot W U, B Z=\) counter reading or consumption
    IE
```

## Start of operation

The user reads on site the initial count from the electricity meter and presses the key on the MR-SI4. After this key press, the pulse counter of register IZ is copied into register IT.
Afterwards, the user configures the MR-SI4 via the Modbus using a service program. The following must be entered:

- initial counter reading from the counter
- pulses per unit,
e.g. indication on the electricity meter 2000 pulses per kWh
- formula type for calculation with transformation factors
- factor for current transformation,
e.g. indication on the transformer 200/5A $\rightarrow$ factor $=40$
- factor for voltage conversion,
e.g. indication on the transformer 20000/100V $\rightarrow$ factor $=200$
- number of digits and places after the decimal point
- deactivate the key to protect the IT register

## Details for calculation

The calculated counter reading should behave exactly as the electricity meter. This requires that there should be no overflows and rounding errors for the intermediate results.
Therefore, particularly large data types are used for counting and calculation
Every 60 milliseconds, a pulse can be emitted by the electricity meter. This results in up to $1,440,000$ pulses per day or about $526,000,000$ pulses per year.
If the pulse counter was realized with 4 bytes, it could be count to 4,294,967,295. At highest pulse frequency, this would be enough for approx. 8.2 years.
Therefore it is provided with 6 bytes and cannot overflow.

The number of places after the decimal point is considered as an additional multiplier with a power of ten during the calculation. Furthermore, it determines the place of the decimal point in the display of BZ and AZ.
As for the electricity counter which only has a specified number of decimal places, the number of places is limited with the last step in the calculation. This is why the calculated counter reading of the MR-SI4 overflows to 0 as often as the counter reading of the electricity meter.

Calculated counter reading if $W \mathbf{W P}=0$ :
$\mathrm{BZ}=($ (uint96_t) (IZ -IT$)$ * WU * WI * power of ten [places after decimal point] / IE + (uint96_t) AZ * WU * WI ) \% power of ten [counter digits]
Calculated counter reading if $W P=1$ :
$B Z=(($ uint96_t) (IZ - IT) * WU * WI * power of ten [places after decimal point] / IE + (uint96_t) AZ )
\% power of ten [counter digits]

## Value Register 66:

Time constant for communication monitoring.
Register Value $=0(0 x 0000)$ (default) there is no communication monitoring, all other values are for communication monitoring with a solution of 10 ms .
$0 \times 0001$ to $0 x F F F F=>0.01$ to 655.35 seconds $=10.9$ minutes

## Registers in operating modes for fire dampers

Values Register 2: Operating mode for channel 1 (OperMode_1) or
Values Register 3: Operating mode for channel 2 (OperMode_2) or

| Value | Name | Description |
| :---: | :--- | :--- |
| 0 | Direct_Control | Direct control of inputs and outputs, <br> factory setting 0 |
| 1 | Motorized_SafetyOpen | Motorized fire damper, <br> safe position open (smoke damper) |
| 2 | Motorized_SafetyClose | Motorized fire damper, <br> safe position closed |
| 3 | LimitSwitch_Open_Close | Mechanical fire damper with <br> OPEN and CLOSE limit switch |
| 4 | LimitSwitch_Open | 2 mechanical fire dampers only with <br> OPEN limit switch (NO contact) |
| 5 | LimitSwitch_Close | 2 mechanical fire dampers <br> only with CLOSE limit switch (NC contact) |

Values Register 4: Maximum opening duration of fire damper 1 (DriveTime_1) or
Values Register 5: Maximum opening duration of fire damper 2 (DriveTime_2)

| Value | Information |
| :---: | :--- |
| $0 \ldots 65535$ | Resolution 0.1 seconds, factory setting 240 seconds, storage in <br> EEPROM |

Values Register 6: Maximum closing duration of fire damper 1 (TurnOffTime_1) or Values Register 7: Maximum closing duration of fire damper 2 (TurnOffTime_2)

| Value | Information |
| :---: | :--- |
| $0 \ldots 65535$ | Resolution 0.1 second, factory setting 35 seconds, storage in <br> EEPROM |

Values Register 8: Maximum duration between write accesses to ActuDrive_1
(RcvHeartBeat_1) or
Values Register 9: Maximum duration between write accesses to ActuDrive_2
(RcvHeartBeat_2)

| Value | Information |
| :---: | :--- |
| $0 \ldots 65535$ | Resolution 0.1 second, factory setting 0 seconds, storage in <br> EEPROM |

Values Register 10: Position control of fire damper 1 (ActuDrive_1) or
Values Register 11: Position control of fire damper 2 (ActuDrive_2)

| Value | Information |
| :---: | :--- |
| 1 | Open fire damper |
| 2 | Close fire damper |

Values Register 12: Position request of the 1st fire damper (ActuPos_1) or
Values Register 13: Position request of the 1st fire damper (ActuPos_2)

| Value | Information |
| :---: | :--- |
| 1 | Fire damper open |
| 2 | Fire damper closed |
| 3 | Fire damper moving |

Values Register 14: Position request of the 2nd fire damper (ActuPos_1a) or Values Register 15: Position request of the 2nd fire damper (ActuPos_2a)

| Value | Information |
| :---: | :--- |
| 1 | Fire damper open |
| 2 | Fire damper closed |
| 3 | Fire damper moving |

Values Register 16: Reporting and reset of alarm codes Channel 1(AlarmCode_1) or Values Register 17: Reporting and reset of alarm codes Channel 2(AlarmCode_2)

| Value | Information |
| :---: | :--- |
| 1 | OK, no alarm |
| 3 | Runtime_Error |
| 4 | Manipulation |
| 5 | Update_Error |
| 6 | Alarm |
| 7 | Alarm_a |

## Detailed description for operating modes for fire dampers

## ActuDrive_1... 2

Only with operating mode Motorized_SafetyOpen and Motorized_SafetyClose.
The damper position is controlled in this register.
Values: open (1), close (2), basic setting after reset is the normal position.

## ActuPos_1... 2

Operating modes Motorized_SafetyOpen, Motorized_SafetyClose and
LimitSwitch_Open_Close:
The damper position is reported in this register.
The report comes from limit switches OPEN1, CLOSED1, OPEN2, CLOSED2 (NO).
Values: open (1), close (2), running (3).

Operating modes LimitSwitch_Open and LimitSwitch_Close:
The damper position is reported in this register.
The report comes from limit switches at inputs OPEN1/CLOSE1, OPEN2/CLOSE2
(NO contact for LimitSwitch_Open, NC contact for LimitSwitch_Close).
Values: open (1), close (2).
ActuPos_1a...2a
Operating modes Motorized_SafetyOpen, Motorized_SafetyClose and
LimitSwitch_Open_Close:
Values: inactive (0).
Operating modes LimitSwitch_Open and Limit_Switch_Close:
In this register, the position of the second fire damper is reported.
The report comes from the limit switches at inputs OPEN1a/CLOSE1a, OPEN2a/CLOSE2a
(NO contact for LimitSwitch_Open, NC contact for LimitSwitch_Close).
Values: open (1), close (2).

## AlarmCode_1... 2

In this register, the error states are reported. The first error code (3...7) is stored until it has been eliminated, only after that another error message is possible.
The values and resetting of errors are described below.
Values with operating mode Motorized_SafetyOpen and Motorized_SafetyClose:
OK (1), Runtime_Error (3), Manipulation (4), Update_Error (5), Alarm (6).
Values with operating mode LimitSwitch_Open_Close:
OK (1), Manipulation (4), Alarm (6).
Values with operating modes LimitSwitch_Open and LimitSwitch_Close:
OK (1), Alarm (6) for inputs OPEN1/CLOSE1, OPEN2/CLOSE2,
Alarm_a (7) for inputs OPEN1a/CLOSE1a, OPEN2a/CLOSE2a.
Alarm (6) has priority over Alarm_a (7), if both dampers are in Fire position.
DriveTime_1... 2
Only with operating mode Motorized_SafetyOpen and Motorized_SafetyClose.
The maximum opening duration of the damper is set in this register.
If the time is exceeded, the alarm code Runtime_Error is reported.
For value 0 , the time measurement is off.
Values: $0 . . .6553 .5 \mathrm{sec} .$, resolution 0.1 sec ., factory setting 240 sec .

## TurnOffTime_1... 2

Only with operating mode Motorized_SafetyOpen and Motorized_SafetyClose.
The maximum closing duration of the damper is set in this register.
If the time is exceeded, the alarm code Runtime_Error is reported.
For value 0 , the time measurement is off.
Values: $0 . . .6553 .5 \mathrm{sec}$., resolution $0.1 \mathrm{sec} .$, factory setting 35 sec .

## RcvHeartBeat_1... 2

Only with operating mode Motorized_SafetyOpen and Motorized_SafetyClose.
The maximum duration between write accesses is set in ActuDrive_1...2. It can be used to implement connection monitoring.
If the time is exceeded, the alarm code Update_Error is reported.
For value 0 , the time measurement is off.
Values: $0 . . .6553 .5 \mathrm{sec}$., resolution 0.1 sec ., factory setting 0 sec .

## Limit switches of fire dampers

The limit switches are connected to the input terminals as follows:

| Terminals | Damper | Operating modes <br> Motorized_SafetyOpen, <br> Motorized_SafetyClose, <br> LimitSwitch_Open_Close <br> (NO contact) | Damper | Operating modes <br> LimitSwitch_Open <br> (NO contact), <br> LimitSwitch_Close <br> (NC contact) |
| :--- | :--- | :--- | :--- | :--- |
| $1-$ C1 | OPEN1 | Damper 1 open | OPEN1/CLOSE1 | Damper 1 |
| $2-$ C1 | CLOSED1 | Damper 1 closed | OPEN1a/CLOSE1a | Damper 1a |
| $3-$ C1 | OPEN2 | Damper 2 open | OPEN2/CLOSE2 | Damper 2 |
| $4-$ C1 | CLOSED2 | Damper 2 closed | OPEN2a/CLOSE2a | Damper 2a |

The operating modes LimitSwitch_Open and LimitSwitch_Close only have different names and are completely identical. If the damper is open completely, the contact is closed.

## Fire position

Depending on the operating mode, the fire position is derived from the limit switches.

| Operating mode | Fire position if |
| :--- | :--- |
| Motorized_SafetyClose | Damper not OPEN |
| Motorized_SafetyOpen | Damper not CLOSED |
| LimitSwitch_Open_Close | Damper not OPEN |
| LimitSwitch_Open | minimum 1 damper not OPEN |
| LimitSwitch_Close | minimum 1 damper CLOSED |

If the damper position is Fire position and no other alarm code has been reported yet, alarm is reported in the AlarmCode register.
For the operating modes LimitSwitch_Open and LimitSwitch_Close, the alarm for the first damper or alarm_a for the second damper is reported. Alarm has priority over Alarm_a.
In the operating modes Motorized_SafetyOpen and Motorized_SafetyClose, self-holding in the safe position can be activated via the Fire position. Then the relay is switched to the safe state. To move the fire damper to the normal position, first, the normal position is
written in ActuDrive and then the AlarmCode is reset to OK. Then the alarm reset is initiated during which the self-holding is interrupted.

## Error detection and alarm codes

There are 3 error sources which are reported as alarm code and partially lead to automatic control of the motorized fire damper.

```
Runtime_Error
(Operating mode Motorized_SafetyOpen, Motorized_SafetyClose)
```

The time during which the damper opens or closes can be measured. If the allowed duration is exceeded, this error will be reported.
The time measurement with DriveTime_1... 2 starts when the relay is switched on (open damper) and ends when the limit switches report the OPEN position.
The time measurement with TurnOffTime_1... 2 starts when the relay is switched off (close damper) and ends when the limit switches report the CLOSED position.
Each of the 2 time measurements can be switched off using the value 0 .
An error remains stored, then the relay switches to the safe position.
Possible causes: damper becomes jammed, limit switch defective, input for limit switch defective, cable to the limit switch interrupted, cable to the motor interrupted, motor defective.

## Manipulation

(Operating mode Motorized_SafetyOpen, Motorized_SafetyClose, LimitSwitch_Open_Close) If both limit switches are switched on simultaneously, this error will be reported.
In ActuPos_1...2, the running value is reported at the same time.
An error remains stored, then the relay is switched off.
Possible causes: limit switch defective, input for limit switch defective, cable to the limit switch short-circuited.

```
Update_Error
(Operating mode Motorized_SafetyOpen, Motorized_SafetyClose)
```

The time interval between write accesses to ActuDrive_1... 2 can be monitored. If the allowed duration (RcvHeartBeat_1...2) is exceeded, this error will be reported.
The monitoring also starts if the error is reset or RcvHeartBeat is set to unequal to 0 .
The time measurement can be switched off using the value 0.
An error remains stored, then the relay switches to the safe position.
Possible causes: remote terminal on the bus out of operation, bus connection interrupted (e.g. cable, repeater, switch).

## Several errors simultaneously

Even if several errors occur in one channel simultaneously, the error handling is carried out only for the first detected error. Only after confirmation by resetting it to OK (alarm reset), another error can be detected.

## Fire damper (Motorized_SafetyClose)

Depending on the alarm reset, fire position, ActuDrive1... 2 and error state, the relay is switched as follows (evaluation from top to bottom):

| Other | ActuDrive_1...2 | AlarmCode_1...2 | Relay 1...2 |
| :--- | :--- | :--- | :--- |
| Alarm reset | open (1) | OK (1) | On |
| Fire position | any | any | Off |
|  | any | Runtime_Error (3) | Off |
|  | any | Update_Error (5) | Off |
|  | any | Manipulation (4) | Off |
|  | open (1) | OK (1) | On |
|  | close (2) | OK (1) | Off |

Initialization after switch-on / reset:
ActuDrive is set to open. AlarmCode is set to OK. The alarm reset starts to interrupt the self-holding in the safe state via fire position.

## Smoke damper (Motorized_SafetyOpen)

Depending on the alarm reset, fire position, ActuDrive1... 2 and error state, the relay is switched as follows (evaluation from top to bottom):

| Other | ActuDrive_1...2 | AlarmCode_1...2 | Relay 1...2 |
| :--- | :--- | :--- | :--- |
| Alarm reset | close (2) | OK (1) | Off |
| Fire position | any | any | On |
| - | any | Runtime_Error (3) | On |
|  | any | Update_Error (5) | On |
|  | any | Manipulation (4) | Off |
|  | open (1) | OK (1) | On |
|  | close (2) | OK (1) | Off |

Initialization after switch-on / reset:
ActuDrive is set to close. AlarmCode is set to OK. The alarm reset starts to interrupt the selfholding in the safe state via fire position.

## Operating modes

The operating mode is selected by using the low bits of the operating mode register. The high bits contain more flags for sunblind operation (sunblind $1 / 2$ ).
In all operating modes, a pause of 0.5 seconds of the Off status is included between level 1 and level 2 when the relay outputs are switched.

## Operating mode 0 (Modbus Off)

The digital inputs and transistor outputs are queried and controlled by the Modbus.
The relay outputs are only controlled via the built-in trigger switches.
Function of the trigger switches: Top $=$ level 1, center $=$ OFF, bottom $=$ level 2.

## Operating mode 1 (Switch 0-1-2)

The digital inputs and transistor outputs are queried and controlled by the Modbus.
The relay outputs are controlled by the Modbus or by the built-in trigger switches.
Function of the trigger switches: Top = OFF, center $=$ level 1, bottom $=$ level 2.

## Operating mode 2 (Switch 1-0-2)

The digital inputs and transistor outputs are queried and controlled by the Modbus.
The relay outputs are controlled by the Modbus or by the built-in trigger switches.
Function of the trigger switches: Top $=$ level 1, center $=$ OFF, bottom $=$ level 2.

## Operating mode 3 (Sunblind 1)

Unused digital inputs and transistor outputs are queried and controlled by the Modbus.
The relay outputs and digital inputs are used to control 2 sunblinds.
Used for AC/DC motors with separate coils for opening and closing.
Relay contact 11: operating voltage for motor 1
Relay contact 14: motor and limit switch 1 for opening
Relay contact 24: motor and limit switch 1 for closing
Relay contact 31: operating voltage for motor 2
Relay contact 34: motor and limit switch 2 for opening
Relay contact 44: motor and limit switch 2 for closing
Operating push-buttons and switching contacts are connected to the digital inputs.
Input 1: open sunblind 1
Input 2: close sunblind 1
Input 3: optional wind contact (NC or NO contact)
Input 4: open sunblind 2
Input 5: close sunblind 2
Input 6: optional door contact (NC or NO contact)

We realize ideas

## Operating mode 4 (Sunblind 2)

Unused digital inputs and transistor outputs are queried and controlled by the Modbus.
The relay outputs and digital inputs are used to control the sunblind.
Used for a DC motor that changes its direction of movement with polarity.
Relay contact 11: motor limit switches, open +, close -
Relay contact 14: operating voltage +
Relay contact 24: operating voltage -
Relay contact 31: motor limit switches, open -, close +
Relay contact 34: operating voltage -
Relay contact 44: operating voltage +
Operating push-buttons and switching contacts are connected to the digital inputs.
Input 1: open sunblind
Input 2: close sunblind
Input 3: optional wind contact (NC or NO contact)
Input 6: optional door contact (NC or NO contact)
Sunblind operating modes
Function of the trigger switches:
top $=$ level $1 /$ opening, center $=$ OFF, bottom $=$ level $2 /$ closing.

| Priorities of relay control, value is returned with relay status |  |  |
| :--- | :--- | :--- |
| Priority | Value | Description |
| Highest | 3 | Trigger switch in the device |
|  | 2 | Wind and door contact |
|  | 1 | Sunblind command |
| Lowest | 0 | Inputs for operating keys |

When the optional wind contact is activated, the sunblind is opened.
The activation of the wind contact has the same effect as the sunblind command 2.
When the optional door contact is activated, the sunblind is prevented from closing.

Different operation modes and time constants can be set for the operation pushbuttons.

| Flags in operating mode register for sunblind mode |  |  |
| :--- | :--- | :--- |
| Bit | Value | Description |
| 15 | 0 | No wind contact at input 3 |
|  | 1 | Wind contact at input 3 |

Simultaneous control of both sunblinds with the sunblind command register is possible via the bus. The command sequence begins as soon as the register content is changed.

| Coding of the sunblind commands |  |
| :--- | :--- |
| 0 | Normal operation, control by operating pushbuttons possible |
| 1 | Switch off relay, lock control by operation pushbuttons (lock) |
| 2 | Long pulse for opening, then lock |
| 3 | Long pulse for closing, then lock |
| 4 | Long pulse for closing, then rotating pulse (blades horizontal), then lock |

Measurement with interpolation chart:

| Dec | Hex | Measuring range | Data type | Interpolation |
| :--- | :--- | :--- | :--- | :--- |
| 240 | 0xF0 | Voltage 0 to 10V | float | linear |
| 241 | 0xF1 |  | signed int | linear |
| 242 | 0xF2 |  | float | exponential |
| 243 | 0xF3 |  | signed int | exponential |
| 244 | $0 x F 4$ | Voltage/Pullup | float | linear |
| 245 | $0 \times F 5$ |  | signed int | linear |
| 246 | $0 \times F 6$ |  | float | exponential |
| 247 | 0xF7 |  | signed int | exponential |
| 248 | 0xF8 | Resistance | float | linear |
| 249 | 0xF9 |  | signed int | linear |
| 250 | 0xFA |  | float | exponential |
| 251 | 0xFB |  | signed int | exponential |

## Registers 24-63 (0x18-0x3F) interpolation chart

This chart can be used to convert and linearize values for sensors without a characteristic already defined in the device. The chart contains up to 10 nodes of the sensor characteristic to interpolate between.

Example: transformation from resistance to temperature for temperature sensors.
Register contents is stored in the EEPROM.
The description refers to temperature sensors. Other sensors than temperature sensors (e.g. humidity) are also possible and it is also possible to measure voltage instead of resistance.

These properties can be set in the configuration register:

Measuring range

Interpolation

Data type of measuring range
voltage
voltage, pullup $2 k$ at 5 V (for ex. for LM235)
resistance (normal case with temperature sensors)
sensor characteristic is nearly linear
sensor characteristic is nearly exponential
(for NTCs)
float (unit $1^{\circ} \mathrm{C}$ )
signed int (unit $0.1^{\circ} \mathrm{C}$ )

| Node | Registers | Registers |
| :---: | :---: | :---: |
|  | Temperature | Resistance |
| 1 | $24-25$ | $26-27$ |
| 2 | $28-29$ | $30-31$ |
| 3 | $32-33$ | $34-35$ |
| 4 | $36-37$ | $38-39$ |
| 5 | $40-41$ | $42-43$ |
| 6 | $44-45$ | $46-47$ |
| 7 | $48-49$ | $50-51$ |
| 8 | $52-53$ | $54-55$ |
| 9 | $56-57$ | $58-59$ |
| 10 | $60-61$ | $62-63$ |

The nodes are filled beginning at the top of the chart, with a maximum of 10, and end with temperature $=$ resistance $=0$, if there are less nodes. Temperature and resistance values have to be in ascending or descending order. So the combination 0,0 as a node is not allowed. Data type in the registers: float temperature, float resistance.

## Registers 24-63 (0x18-0x3F) interpolation chart

This chart can be used to convert and linearize values for sensors without a characteristic already defined in the device. The chart contains up to 10 nodes of the sensor characteristic to interpolate between.
Example: transformation from resistance to temperature for temperature sensors.
Register contents is stored in the EEPROM.
The description refers to temperature sensors. Other sensors than temperature sensors (e.g. humidity) are also possible and it is also possible to measure voltage instead of resistance.
These properties can be set in the configuration register:

Measuring range

Interpolation

Data type of measuring range
voltage
voltage, pullup 2k at 5 V (for ex. for LM235)
resistance (normal case with temperature sensors)
sensor characteristic is nearly linear
sensor characteristic is nearly exponential
(for NTCs)
float (unit $1^{\circ} \mathrm{C}$ )
signed int (unit $0.1^{\circ} \mathrm{C}$ )

| Node | Register | Register |
| :---: | :---: | :---: |
|  | Temperature | Resistance |
| 1 | $24-25$ | $26-27$ |
| 2 | $28-29$ | $30-31$ |
| 3 | $32-33$ | $34-35$ |
| 4 | $36-37$ | $38-39$ |
| 5 | $40-41$ | $42-43$ |
| 6 | $44-45$ | $46-47$ |
| 7 | $48-49$ | $50-51$ |
| 8 | $52-53$ | $54-55$ |
| 9 | $56-57$ | $58-59$ |
| 10 | $60-61$ | $62-63$ |

The nodes are filled beginning at the top of the chart, with a maximum of 10, and end with temperature $=$ resistance $=0$, if there are less nodes. Temperature and resistance values have to be in ascending or descending order. So the combination 0,0 as a node is not allowed. Data type in the registers: float temperature, float resistance.

## Function block PID controller (PID1-PID2)

## General information on the controller type

The MR-AIO4/2 contains 2 PID controllers for applications for temperature control.

## T1 filter

An ideal PID controller causes problems due to differentiation component:

- Quick changes at the input lead to restriction at the controller output and, thus, to non-linear behavior. (This may also be desired.)
- Noise and other interferences of the input measured values are intensified.

Therefore, real PID controllers are implemented with an additional T1 filter with smaller time constant T1 (PIDT1 controller). The filter can only be assigned to the D component or to P, I and D components together. For this controller, it applies only to the D component.

## Differentiator input

The D component can be calculated from the difference of nominal value and actual value $\pm(\mathrm{X}-\mathrm{W})$ or directly from the actual value $\pm \mathrm{X}$ (this option can be switched). A quick change of the nominal value does not affect the output if the actual value is used directly.

## Differential equation

This differential equation is used to define the function and variables:

$$
\begin{aligned}
& Y=Y p+Y i+Y d t \\
& Y p=F p \cdot X w \\
& Y i=F p \cdot \frac{1}{T i} \cdot \int_{0}^{t}(X w) d \tau \\
& Y d t+T 1 \cdot \frac{d(Y d t)}{d t}=F p \cdot T d \cdot \frac{d(X w d)}{d t}
\end{aligned}
$$

with $\mathrm{W}=$ nominal value
$X=$ actual value
$\mathrm{Xw}=$ difference $\pm(\mathrm{X}-\mathrm{W})$
$X w d=X w$ or $\pm X$
$Y=$ controller output
time
$\mathrm{Yi}=$ integral component
Ydt = differential component filtered
$\mathrm{Fp}=$ gain
$\mathrm{Ti}=$ integration time constant, reset time
$\mathrm{Td}=$ differential time constant, derivative action
$\mathrm{Yp}=$ proportional component $\mathrm{T} 1=$ filter time constant

## Output limitation

The I-share Yi and the Y output are limited by the Ymin and Ymax constants.
In addition, the Y output is limited by the values which can be changed during operation.
PID1 controller has the input Amin which represents the lower limit for its Y output.
PID2 controller has the Bmax input which represents the upper limit for its $Y$ output.

## Dead range

This parameter can be used to prevent continuous small changes at the Y output.
Otherwise, they can lead to wear of the valve controlled by the output.
The Y output changes if the change is greater than DeadR and remains constant in all other cases.

## Manual operation

In the Automatic mode, the value at the Y output is also constantly saved in ManY register. If the controller is switched to the Manual mode, it keeps its last value.
By changing the ManY in the Manual mode, the Y output is set to the new value. If the Manual mode is quit, the Y output starts controlling at the current value.

## Activity

The controller can be set to activated or deactivated.
If it is deactivated, the $Y$ output is set to Deact $Y$ permanently.
If it is activated, the Y output starts its controlling activity with the InitY value.

## Controller structure

## Controller algorithm

$\begin{array}{ll}\text { (Parameter): } & \text { if (PropF) } \\ & \text { else }\end{array}$

## Function block Linear mapping with limitation (LCL1-LCL4)

## Description LCL1 - LCL2

The function block has the $X$ input and $Y$ output. Between two limits ( $\mathrm{X} 1, \mathrm{X} 2$ ), the input values are shown on a linear map relative to the output values (Y1...Y2). Outside the limits, the output values are limited to Y1 or Y2.

## Modbus registers

The parameters belong to the float data type. They are saved permanently in EEPROM.
Separate holding registers for each function block LCL1 ...LCL2:

| Name | Configuration Registers, storage in EEPROM <br> (Modbus Holding Registers) | Adr. <br> LCL1 | Adr. <br> LCL2 |  |
| :--- | :--- | :--- | :--- | :--- |
| Y1 | Point1, output Y | (Default 0) | 200 | 208 |
| Y2 | Point2, output Y | (Default 100) | 202 | 210 |
| X1 | Point1, input X | (Default 0) | 204 | 212 |
| X2 | Point2, input X | (Default 100) | 206 | 214 |

## Description LCL3-LCL4

The function block has the X input and Y output. Two points (X1, Y1) and (X2, Y2) define how the input values are mapped to the output values.
The output values are limited to Y3 (minimum) or Y4 (maximum).

## Modbus registers

The parameters belong to the float data type. They are saved permanently in EEPROM. Separate holding registers for each function block LCL1 ...LCL4:

| Name | Configuration Registers, storage in EEPROM <br> (Modbus Holding Registers) | Adr. <br> LCL3 | Adr. <br> LCL4 |  |
| :--- | :--- | :--- | :--- | :--- |
| Y1 | Point1, output Y | (Default 0) | 216 | 228 |
| Y2 | Point2, output Y | (Default 100) | 218 | 230 |
| X1 | Point1, input X | (Default 0) | 220 | 232 |
| X2 | Point2, input X | (Default 100) | 222 | 234 |
| Y3 | Lower limit of output Y | (Default 0) | 224 | 236 |
| Y4 | Upper limit of output Y | (Default 100) | 226 | 238 |

## Wiring the function blocks

## Overview

Depending on the operating mode, nominal value and actual value can originate from the analog inputs. These inputs provide values in Volts, Ohms or degrees of Celsius. If the function block Linear conversion / limit or freely programmable interpolation table is used in the analog input, adjustment to other value ranges and units can be performed at the controller input.

If the controller nominal value is set via Modbus, there are 2 separate registers:

- The initial nominal value InitW_1/2 is saved permanently in EEPROM.
- The nominal value W_1/2 can be written or read out anytime using Modbus.

The output value for an analog output can originate from the registers Outl and OutF or from a PID controller. After each selection, the output value is reported in OutL and OutF. When switching on the device and after the Watchdog timer has elapsed, these registers are copied:
Default setting Current value
InitOutl_1/2 $\rightarrow$ Outl_1/2
InitOutF_1/2 $\rightarrow$ OutF_1/2
InitW_1/2 $\rightarrow$ W_1/2

## Modbus registers

One PID controller is assigned to one output and 2 inputs respectively.
A register contains fields for the switches shown in the figure.
Other registers contain the nominal value and output value.

| Name | Configuration Registers, storage in EEPROM (Modbus Holding Registers) | Adr. |
| :---: | :---: | :---: |
| Switch | Selection of signals (Default 0) | 100 |

## I/O commands

Modbus Function "03 (0x03) Read Holding Registers" (R)
Modbus Function "04 (0x04) Read Input Registers" (R)
Modbus Function "06 (0x06) Write Single Register" (W)
Modbus Function "16 (0x10) Write Multiple Registers" (W)

## Information

The Input Registers 0 and 31 to 38 are only relevant for production process.
Read Holding Registers (0-127, 256-383, 512-639, 768-895)
Read Input Registers (0-127, 256 - 383, 512-639, 768-895)
Write Single Register (0, 31, 32, 42 to 59, 65, 120-127)
Write Multiple Registers (42 to 59, 65, 120-127)

| 256- | Recording of measured values voltage L1-N | signed | 0.1 V |
| :---: | :---: | :---: | :---: |
| 383 | Recording of measured values voltage L2-N |  |  |
| 512- | Recording of measured values voltage L3-N | R |  |
| 639 | The wave shape of the three voltages can be |  |  |
| $\begin{aligned} & 768- \\ & 895 \end{aligned}$ | determined with 128 recorded measured values of each phase. |  |  |
|  | Recording of measured voltage values stops when error bits are set, so that the cause of error can later be determined on the basis of the wave shape. |  |  |

At a RMS voltage less than 25 V the values of voltage, current, frequency and power are transmitted as 0 .

The registers are updated with new measured values once per second.

## Special data types

For Modbus applies, that in case of data with a length of several Bytes the High Byte will be transmitted first and the Low Byte last (Big-Endian). Data types with a length of multiple registers are described below.

If a data type needs several registers they should be read or written all together in one command to assure consistency of data. Registers can be accessed individually but then the user has to assure that data are consistent, for example with multiple queries.

## Data type unsigned long

This data type uses 2 registers each, that means 4 Bytes.

| Register addresses | Register +0 | Register + 1 |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Bytes in order of <br> transmission | Byte 1 <br> High | Byte 2 <br> Low | Byte 3 <br> High | Byte 4 |
| Bit numbers | Bit 31-24 | Bit 23-16 | Bit 15-8 | Bit 7-0 |

## Data type float

This data type uses 2 registers each, that means 4 Bytes.

| Register addresses | Register +0 | Register + 1 |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Bytes in order of <br> transmission | Byte 1 <br> High | Byte 2 <br> Low | Byte 3 <br> High | Byte 4 <br> Low |
| Bit numbers | Bit 31-24 | Bit 23-16 | Bit 15-8 | Bit 7-0 |
| Bits of float value | Sign, Exp 7-1 | Exp 0, Mant 22-16 | Mant 15-8 | Mant 7-0 |

Indication of a compatibility problem:
4 different orders of the bytes in the registers are used in the market for data type "Float".

## Configuration of the terminal block contacts

1La, 2La, 3La Phase supply
1Lb, 2Lb, 3Lb Phase consumer
1N, 2N, 3N Neutral lead
At the contacts of the neutral lead the supply and consumer should not only be connected via the PC board because otherwise the power loss in the device is getting too high. The two neutral lead terminal blocks have to be connected by an external bridge if both are used.

| Write Single Register | $(0-99)$ |

## Function block Bus-Watchdog

The Modbus communication may be controlled by a watchdog timer. The timer restarts with every valid message, that was directed to the device. Only the devices address is relevant, not the rest of the message. If the bus master or the connection fails and the timer will elapse, the outputs switch to their default values (save state) and the red LED will shine. With the time constants value of 0 the watchdog timer is inactive.

| Holding Registers |  |
| :--- | :--- |
| Addr. | Description |
| 66 | Time constant of communication monitoring |
|  | Data type uint16, resolution 10 ms <br> Maximum value $=65535=655.35$ seconds $=10.9$ minutes <br> Factory default 0 (watchdog inactive) <br> Storage in EEPROM |

While defining the time constant you have to respect several items, which effects how offen the slave has to be addressed:

- Baudrate of the system
- Number of slaves
- Length of the messages of each slave
- Priorities while addressing the slaves
- Transmission errors cause timeouts and repetitions
- Capability and processor load of the master

## Function block Digital Input

On each input a yellow LED shows the status.

| Discrete Inputs |  |
| :--- | :--- |
| Addr. | Description |
| $0-10$ | Value of digital inputs 1...11 |
| 11 | Value of digital input S0 (usable as counter input) <br> Value 0: off, 1: on |

| Input Registers / Holding Registers |  |
| :--- | :--- |
| Addr. | Description |
| 70 | Value of digital inputs <br> Same as Discrete Inputs 0-15 |

## Function block Digital Output

The relay outputs may be overdriven by push buttons, not the Photo-MOS outputs.
A long keystroke ( $>1 \mathrm{~s}$ ) changes between automatic und manual operation.
A short keystroke ( $<1$ s) changes in manual operation between Off and On.
On each output a yellow LED shows the status, a green LED shows if it is manual operation.

| Coils |  |
| :--- | :--- |
| Addr. | Description |
| $0-3$ | Value of relay outputs $1 \ldots 4$ <br> Value 0: off, 1: on |
| $4-7$ | Value of Photo-MOS outputs 1...4 <br> Value 0: off, 1: on |

| $16-19$ | Operating mode of relay outputs $1 \ldots 4$ (read only) <br> Value 0: automatic mode, 1: manual mode <br> Storage in EEPROM |
| :--- | :--- |

| Holding Registers |  |
| :--- | :--- |
| Addr. | Description |
| 71 | Value of digital outputs <br> Same as Coils 0-15 |
| 72 | Operating mode (automatic, manual) of digital outputs (read only) <br> Same as Coils 16-31 <br> Storage in EEPROM |
| 73 | Default values of digital outputs <br> Factory default 0 <br> Storage in EEPROM |

## Function block Analog Output

On each output a yellow LED shows with its brightness the outputs voltage.

| Holding Registers |  |
| :--- | :--- |
| Addr. | Description |
| $74-75$ | Values of analog outputs O1...O2 <br> Data type int16, <br> Range: value $0=0$ Volt,$\ldots$ value $32767=10.24$ Volt |
| $78-79$ | Default values of analog outputs O1...O2 <br> Data type int16, <br> Factory default 0, <br> Storage in EEPROM |

## Function block Analog Input

## Overview

The inputs E1 to E6 universally serve for voltage measuring ( 0 to 11.5 V ) and for resistance measuring ( 40 Ohm to 4 MOhm ). The input I serves for current measuring ( 0 to 22 mA ).

An analog to digital conversion takes about 0.2 seconds and measurements are taken alternatively at the inputs. A measurement is taken at each input with an interval of about 1.8 seconds, it takes a bit longer when the resistance measuring range is changed because several measurements are taken.

There are operating mode to calculate the temperature of standard temperature sensors. The measured voltage or resistance value is converted with a value chart and interpolation into the temperature. There are several pre-programmed charts for standard sensors and a freely programmable chart with up to 10 nodes.

An offset can be added to the measured value. This allows an adaptation to the sensor and the supply line or a fine tuning.

E1...E6, I analog inputs, contacts E1 to E6 and I
Mux input switch
ADC analog-to-digital converter
V/A/Ohm calculate voltage / current / resistance
Interp interpolation with value charts
Sum
addition of an offset
ConstTable value charts for standard sensors
Modbus registers:
Config Configuration Register
Input Measured Value Register
Offset Offset Register
VarTable Value chart for specific sensor type

## Modbus register

The messured values may be configured as float or 16 bit integer with leading sign.

## Input Registers

| Addr. | Al | Name | Description |

| 23 | - |  |  |
| 24-27 $28-31$ $32-35$ $\cdots$ $60-63$ | - | VarTable <br> 1... 10 | Variable lookup table used for interpolation <br> Alternately temperature and resistance (see below). <br> Float in 2 consecutive registers each. <br> Factory default 0. <br> Storage in EEPROM. |

## Configuration registers

Input circuit and measuring range, data type and value unit and the sensor characteristic for usual temperature sensors are set for the 7 inputs with the 7 configuration registers. With the aid of the following charts the values of the registers are shown decimal and hexadecimal.

Voltage, Current or resistance:

| Dec | Hex | Measuring range | Data type | Unit | Maximum |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | $0 \times 00$ | Voltage 0-10V | float | 1 V | 11.5 V |
| 1 | $0 \times 01$ |  | int16_t | 0.3125 mV | 10.24 V |
| 0 | $0 \times 00$ | Current 0-20mA | float | 1 mA | 22 mA |
| 1 | $0 \times 01$ |  | int16_t | $0.625 \mu \mathrm{~A}$ | 20.48 mA |
| 32 | $0 \times 20$ | Voltage 0-10V | float | 1 V | 11.5 V |
| 33 | $0 \times 21$ | Pullup $2 \mathrm{k} \Omega$ at 5 V | int16_t | 0.3125 mV | 10.24 V |
| 64 | $0 \times 40$ | Resistance | float | $1 \Omega$ | $4 \mathrm{M} \Omega$ |
| 65 | $0 \times 41$ |  | int16_t | $0.1 \Omega$ | $3.2767 \mathrm{k} \Omega$ |
| 66 | $0 \times 42$ |  | int16_t | $1 \Omega$ | $32.767 \mathrm{k} \Omega$ |
| 67 | $0 \times 43$ |  | int16_t | $10 \Omega$ | $327.67 \mathrm{k} \Omega$ |
| 68 | $0 \times 44$ |  | int16_t | $100 \Omega$ | $3276.7 \mathrm{k} \Omega$ |

For voltage with type signed integer: $10.24 \mathrm{~V} / 2^{\wedge} 15=1 \mathrm{~V} / 3200=0.3125 \mathrm{mV}$
For current with type signed integer: $\quad 20.48 \mathrm{~mA} / 2^{\wedge} 15=1 \mathrm{~mA} / 1600=0.625 \mu \mathrm{~A}$

Temperature measurement with data type float:

| Dec | Hex | Measuring range | Data type | Unit | Range |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 128 | $0 \times 80$ | Sensor PT100 | float | $1^{\circ} \mathrm{C}$ | $-50 . .150^{\circ} \mathrm{C}$ |
| 130 | $0 \times 82$ | Sensor PT500 |  | $-50 . .150^{\circ} \mathrm{C}$ |  |
| 132 | $0 \times 84$ | Sensor PT1000 |  | $-50 . .150^{\circ} \mathrm{C}$ |  |
| 134 | $0 \times 86$ | Sensor NI1000-TK5000 |  | $-50 . .150^{\circ} \mathrm{C}$ |  |
| 136 | $0 \times 88$ | Sensor NI1000-TK6180 |  | $-50 . .150^{\circ} \mathrm{C}$ |  |
| 138 | $0 \times 8 A$ | Sensor BALCO 500 |  | $-50 . .150^{\circ} \mathrm{C}$ |  |
| 140 | $0 \times 8 \mathrm{C}$ | Sensor KTY81-110 NXP |  | $-50 . .150^{\circ} \mathrm{C}$ |  |
| 142 | $0 \times 8 \mathrm{E}$ | Sensor KTY81-210 NXP |  | $-50 . .150^{\circ} \mathrm{C}$ |  |
| 144 | $0 \times 90$ | Sensor NTC-1k8 Thermokon |  | $-50 . .150^{\circ} \mathrm{C}$ |  |
| 146 | $0 \times 92$ | Sensor NTC-5k Thermokon |  | $-50 . .150^{\circ} \mathrm{C}$ |  |
| 148 | $0 \times 94$ | Sensor NTC-10k Thermokon |  | $-50 . .150^{\circ} \mathrm{C}$ |  |
| 150 | $0 \times 96$ | Sensor NTC-20k Thermokon |  | $-50 . .150^{\circ} \mathrm{C}$ |  |
| 152 | $0 \times 98$ | Sensor LM235 |  |  | $-40 . .120^{\circ} \mathrm{C}$ |

Temperature measurement with data type signed int (register number is by 1 larger than above):

| 129 | $0 \times 81$ | Sensor PT100 | int16_t | $0.1^{\circ} \mathrm{C}$ | $-50 . .150^{\circ} \mathrm{C}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 131 | $0 \times 83$ | Sensor PT500 |  |  |  |
| $\ldots$ | $\ldots$ | $\ldots$ |  |  |  |
| 153 | $0 \times 99$ | $-50 . .150^{\circ} \mathrm{C}$ <br> Sensor LM235 <br> Register value is 1 larger than <br> above |  |  |  |

Measurement with interpolation chart:

| Dec | Hex | Measuring range | Data type | Interpolation |
| :--- | :--- | :--- | :--- | :--- |
| 240 | 0xFO | Voltage 0-10V | float | linear |
| 241 | 0xF1 |  | int16_t | linear |
| 242 | 0xF2 |  | float | exponential |
| 243 | 0xF3 |  | int16_t | exponential |
| 244 | $0 x F 4$ | Voltage 0-10V | float | linear |
| 245 | 0xF5 | Pullup 2k at 5V | int16_t | linear |
| 246 | 0xF6 |  | float | exponential |
| 247 | 0xF7 |  | int16_t | exponential |
| 248 | 0xF8 | Resistance | float | linear |
| 249 | 0xF9 |  | int16_t | linear |
| 250 | 0xFA |  | float | exponential |
| 251 | 0xFB |  | int16_t | exponential |

## Interpolation chart

This chart can be used to convert and linearize values for sensors without a characteristic already defined in the device. The chart contains up to 10 nodes of the sensor characteristic to interpolate between.

Example: transformation from resistance to temperature for temperature sensors.
Register contents is stored in the EEPROM.
The description refers to temperature sensors. Other sensors than temperature sensors (e.g. humidity) are also possible and it is also possible to measure voltage instead of resistance.

These properties can be set in the configuration register:

Measuring ra
Interpolation

Data type of measuring range
voltage
voltage, pullup $2 k$ at 5 V (for ex. for LM235)
resistance (normal case with temperature sensors)
sensor characteristic is nearly linear
sensor characteristic is nearly exponential
(for NTCs)
float (unit $1^{\circ} \mathrm{C}$ )
signed int (unit $0.1^{\circ} \mathrm{C}$ )

| Node | Register-Address <br> Temperature | Register-Address <br> Resistance |
| :--- | :--- | :--- |
| 1 | $24-25$ | $26-27$ |
| 2 | $28-29$ | $30-31$ |
| $\ldots$ | $\ldots$ | $\ldots$ |
| 10 | $60-61$ | $62-63$ |

The nodes are filled beginning at the top of the chart, with a maximum of 10, and end with temperature $=$ resistance $=0$, if there are less nodes. Temperature and resistance values have to be in ascending or descending order. So the combination 0,0 as a node is not allowed. Data type in the registers: float temperature, float resistance.

## Function duty cycle

The duty cycle of the counter input $\mathrm{SO} 0+/ \mathrm{SO}$ - will be messured. Sample rate is 1 ms .
Modbus register

| Discrete Inputs |  |
| :--- | :--- |
| Addr. | Description |
| 11 | Value of counter input (switch connected to digital input S0) <br> $0:$ inactive (switch open), 1: active (switch closed) |

| Input Registers / Holding Registers |  |
| :--- | :--- |
| Addr. | Description |
| 70 | Value of digital inputs (read only) <br> Same as Discrete Inputs 0-15 |
| $82-83$ | Active time of counter input <br> May be written to initialize second count, simultaneously resets millisecond <br> count <br> Data type uint32, resolution 1 second <br> Storage in EEPROM |

## Function pulse counter

The pulse counter records pulses of a energy meter with SO interface, which is connected to the counter input $\mathrm{SO} 0 / \mathrm{SO} 0$. There are also other applications possible.

## Modbus register

| Discrete Inputs |  |  |
| :--- | :--- | :--- |
| Addr. | Name | Description |
| 11 | IN_C | Value of counter input (switch connected to digital input S0) <br> 0: off (switch open), 1: on (switch closed) |

| Input Registers |  |  |
| :--- | :--- | :--- |
| Addr. | Name | Description |
| 70 | INPUT | Value of digital inputs <br> Same as Discrete Inputs 0-15 |
| $84-87$ | IZ | Pulse counter <br> Data type uint64 (lower 48 bits are used, highest 16 bits are 0) |
| $88-89$ | BZ | Calculated counter reading <br> Data type uint32 |

| Holding Registers |  |  |
| :--- | :--- | :--- |
| Addr. | Name | Description |
| $84-87$ | IT | Copy of pulse counter when key was pressed <br> Value may be overwritten <br> Data type uint64 (lower 48 bits are used, highest 16 bits are 0) <br> Storage in EEPROM |
| $88-89$ | AZ | Initial calculated counter reading <br> Data type uint32 <br> Factory default 0 <br> Storage in EEPROM |
| 90 | IE | Pulses per unit <br> Data type uint16 <br> Factory default 1 <br> Storage in EEPROM |
| 91 | WI | Ratio of current transformer <br> Data type uint16 6 <br> Factory default 1 <br> Storage in EEPROM |

| Holding Registers |  |  |
| :--- | :--- | :--- |
| Addr. | Name | Description |
| 92 | WU | $\begin{array}{l}\text { Ratio of voltage transformer } \\ \text { Data type uint16 } \\ \text { Factory default 1 } \\ \text { Storage in EEPROM }\end{array}$ |
| 93 | WP | $\begin{array}{l}\text { Mode of calculation with current/voltage transformer } \\ \text { Data type: flag in bit 0 } \\ \text { Value 0...1, see below } \\ \text { Factory default 0 } \\ \text { Storage in EEPROM }\end{array}$ |
| 94 | ZS | $\begin{array}{l}\text { Format of counter display } \\ \text { Data type uint16 } \\ \text { High byte contains total counter digits, } \\ \text { range 0...9, factory default 7, } \\ \text { higher values are limited to 9 }\end{array}$ |
| Low byte contains fractional counter digits, |  |  |
| range 0...3, factory default 1, |  |  |
| higher values are limited to 3 |  |  |$\}$| Storage in EEPROM |
| :--- |

## Operating mode for calculation with transformation factor

In the WP register, there is a code $0 . . .1$ that determines, together with the transformation factors WI and WU, the way how they are included in calculation. WP, WI and WU depend on whether the transformers are switched by the counters, whether the counter indicates the consumption in a primary or secondary way and whether the emitted pulses correspond primarily or secondarily to the consumption.
A difference must be made between the following electricity meter types:
Type 1: Directly measuring counter, display: primary, pulse: primary
Note: Indicates the real consumption
Species: DIN rail counter with mechanical drum-type counting mechanism, Ferraris counter
Formula type:
WP = 0
Factors: $\quad \mathrm{WI}=\mathrm{WU}=1$

```
    IZ - IT
\(B Z=(---------+A Z) \cdot W I \cdot W U, B Z=\) counter reading \(=\) consumption
    IE
```

Type 2: Transformer counter, display: primary, pulse: secondary

Note:
Species:
Formula type:
Factors:

Indicates the real consumption
counter with LCD display
$W P=1$
WI and WU correspond to the transformers

```
    IZ - IT
\(B Z=(---------\cdot W I \cdot W U)+A Z, B Z=\) counter reading \(=\) consumption
    IE
```

Type 3: Transformer counter, display: primary, pulse: primary
Note: Indicates the real consumption
Species: counter with LCD display, multi-function counters
Formula type:
WP = 0
Factors:

$$
W I=W U=1
$$

IZ - IT
$B Z=(--------+A Z) \cdot W I \cdot W U, B Z=$ counter reading $=$ consumption IE

Type 4: Transformer counter, display: secondary, pulse: secondary Note: Indicates the consumption reduced by the transformation factors
Species: DIN rail counter with mechanical drum-type counting mechanism, Ferraris counter
Formula type: $W P=0$

Consumption and display of the transformer counter are different. Both can be calculated using a different configuration (WI, WU).

| Factors: | $W \mathrm{I}=\mathrm{WU}=1$ : |
| :---: | :---: |
|  | The calculated counter reading corresponds to the display of the transformer counter. |
| Species: | DIN rail counter with mechanical drum-type counting mechanism, Ferraris counter. |
| IZ - IT |  |
| $B Z=(------$ | $=$ counter reading or consumption |
| IE |  |

## Start of operation

The user reads on site the initial count from the electricity meter and presses the key on the MR-Multi I/O. After this key press, the pulse counter of register IZ is copied into register IT. Afterwards, the user configures the MR-Multi I/O via the Modbus using a service program. The following must be entered:

- initial counter reading from the counter
- pulses per unit,
e.g. indication on the electricity meter 2000 pulses per kWh
- formula type for calculation with transformation factors
- factor for current transformation,
e.g. indication on the transformer 200/5A $\rightarrow$ factor $=40$
- factor for voltage conversion,
e.g. indication on the transformer 20000/100V $\rightarrow$ factor $=200$
- number of digits and places after the decimal point
- deactivate the key to protect the IT register

## Details for calculation

The calculated counter reading should behave exactly as the electricity meter. This requires that there should be no overflows and rounding errors for the intermediate results.
Therefore, particularly large data types are used for counting and calculation
Every 60 milliseconds, a pulse can be emitted by the electricity meter. This results in up to $1,440,000$ pulses per day or about $526,000,000$ pulses per year.
If the pulse counter was realized with 4 bytes, it could be count to 4,294,967,295. At highest pulse frequency, this would be enough for approx. 8.2 years.
Therefore it is provided with 6 bytes and cannot overflow.
The number of places after the decimal point is considered as an additional multiplier with a power of ten during the calculation. Furthermore, it determines the place of the decimal point in the display of $B Z$ and $A Z$.
As for the electricity counter which only has a specified number of decimal places, the number of places is limited with the last step in the calculation. This is why the calculated counter reading of the MR-Multi I/O overflows to 0 as often as the counter reading of the electricity meter.

Calculated counter reading if $\mathrm{WP}=0$ :
$B Z=($ (uint96_t) (IZ $-I T) * W U * W I$ * power of ten [places after decimal point] / IE +
(uint96_t) AZ * WU * WI )
\% power of ten [counter digits]
Calculated counter reading if $\mathrm{WP}=1$ :
$B Z=($ (uint96_t) (IZ - IT) * WU * WI * power of ten [places after decimal point] / IE + (uint96_t) AZ )
\% power of ten [counter digits]

## Note for other applications

For applications with a current meter it is required in order to maintain consistency of data that the pulse counter IZ cannot be deleted. However, it is possible to create a deletable counter with the calculated meter reading BZ by changing the values of IT and/or AZ via the bus.

A simple example without the different factors:
Configuration with: $\mathrm{WP}=0, \mathrm{WU}=\mathrm{WI}=1, \mathrm{IE}=1$, places after decimal point $=0$
Calculation: $\quad B Z=I Z-I T+A Z$
When writing $A Z=0$ and $I T=I Z$, the result is $B Z=0$.

## Function block Bus-Watchdog

The Modbus communication may be controlled by a watchdog timer. The timer restarts with every valid message, that was directed to the device. Only the devices address is relevant, not the rest of the message. If the bus master or the connection fails and the timer will elapse, the outputs switch to their default values (save state) and the red LED will shine. With the time constants value of 0 the watchdog timer is inactive.

| Holding Registers |  |  |
| :--- | :--- | :--- |
| Addr. | Description | BusTimeout |
| 66 |  | Time constant of communication monitoring <br> The time applies only when the relays are controlled via <br> Modbus. The relays switch into the inactive state when the <br> timeout is reached. The time restarts with each valid <br> message that is addressed to the device. |
| Data type uint16, resolution 10 ms |  |  |
|  |  | Maximum value $=65535$ ( $=655.35$ seconds $=10.9$ <br> minutes <br> Factory default 0 (watchdog inactive) <br> Storage in EEPROM |

When defining the time constant several items have to be considered that influence how often a specific slave will be addressed:

- Baud rate of the system
- Number of slaves
- Length of the messages of each slave
- Priorities while addressing the slaves
- Transmission errors cause timeouts and repetitions
- Capability and processor load of the master

| Discrete Inputs (Read-Only) |  |  |
| :--- | :--- | :--- |
| Addr. | Name | Description |
| $0 \ldots 5$ | LeakDetect_1 $\ldots$ <br> LeakDetect_6 | Status bits for the identified leaks <br> A bit is set when SensorResist < SensorThresh. <br> The SensorThresh hysteresis of $\pm 5 \%$ applies for <br> comparison. |
| $16 \ldots 21$ | CableBreak_1 $\ldots$ <br> CableBreak_6 | Status bits for the identified cable breaks <br> A bit is set when ZenerVoltage > ZenerThresh. <br> The ZenerThresh hysteresis of $\pm 2.5 \%$ applies for <br> comparison. |
