# **1** Introduction

### 1.1 Overview

The L-STAT is a network thermostat device with a modern, minimalistic look that fits any interior design. It is directly connected to a LOYTEC controller with a Modbus interface such as LIOB-AIR, L-ROC or L-INX.

Up to 16 L-STAT devices can be connected to one controller to offer control at different locations for the largest rooms. The L-STAT is equipped with a segmented LCD display featuring an RGB backlight with adjustable color, offering a neat way to make the L-STAT match the interior color concept of an office building. Eight capacitive touch buttons are used to cycle through sensor values, display parameters, and adjust setpoints. Up to four external buttons can be accessed and processed by the controller.

The L-STAT's internal sensors measure temperature, humidity, dew point, occupancy and  $CO_2$  level. Sensor values can be displayed in SI or US units. Additionally, the date and time as well as the current level of eco-friendliness are also displayed on the LCD display. Parameters controlled by the controller's logic can be overridden on the L-STAT, such as for occupancy, air conditioning, and ventilation. A direct access mode is available to quickly adjust the most important setpoints e.g. for temperature and ventilation control.

A buzzer provides acoustic feedback for the touch buttons and can also be used to indicate alarms and error states. To prevent unauthorized modifications, two access levels (end user, system integrator) are used, which are secured via 4-digit pin codes. Device replacement, firmware upgrade, and L-STAT configuration are performed with very little effort through the controller. The L-STAT device is represented in the controller by a simple data point interface, which can be directly connected to the IEC 61131 or IEC 61499 logic application and offers all common functions for data points such as alarming, scheduling, trending, historic filters, math functions, etc.

Using an NFC tag, the L-STAT transmits the URL of an L-WEB project to mobile devices for more extensive control and administrative tasks. Last but not least, the L-STAT comes with a built-in infrared receiver for comfortable remote control.

### 1.2 Key Features

Features	LSTAT-800-Gx-Lx	LSTAT-801-Gx-Lx	LSTAT-802-Gx-Lx
Modbus RTU Slave	$\checkmark$	$\checkmark$	$\checkmark$
NFC Tag	$\checkmark$	$\checkmark$	$\checkmark$
Buzzer	$\checkmark$	$\checkmark$	$\checkmark$
Internal Temperature Sensor	$\checkmark$	$\checkmark$	$\checkmark$
Internal Relative Humidity Sensor	$\checkmark$	$\checkmark$	$\checkmark$
3 x Digital Inputs 1 x Analog Input	$\checkmark$	$\checkmark$	$\checkmark$
Infrared Receiver	$\checkmark$	$\checkmark$	$\checkmark$
Occupancy Sensor	-	$\checkmark$	$\checkmark$
CO <sub>2</sub> Sensor	-	-	$\checkmark$

The different L-STAT models and their features are documented in Table 1.

Table 1: Key Features

Not only the model type but also the enclosure color as well as the touch button layout is defined with the order code. See Table 2 for possible order codes.

Table 2: Possible Order Codes

# 1.3 LCD Segments

The following Figure 1 shows the LCD of the L-STAT with all possible segments.

Figure 1: LCD Segments available on L-STAT

The following Table gives an overview of all available segments of the L-STAT LCD with its defined names. The Table also shows which symbols are directly accessible via Modbus registers (see Table 12 on Page 29).

Segment	Name	Description	Direct Access
<u> </u>	heat	Heating symbol	$\checkmark$
$\bigcap$	alarm_bell	Alarm bell symbol	$\checkmark$
۵	drop	Drop symbol	$\checkmark$
<u>ک</u>	drop_not	Cross out for drop symbol	$\checkmark$
$\triangle$	alarm	Alarm symbol	$\checkmark$
$\bigcirc$	light	Light bulb symbol	$\checkmark$
	blinds	Sun blinds symbol	$\checkmark$

Segment	Name	Description	Direct Access
-	clock	Clock symbol	$\checkmark$
*	sun_left	Left half of sun symbol	$\checkmark$
*	sun_right	Right half of sun symbol	$\checkmark$
	moon	Moon symbol	$\checkmark$
].e	colon	The colon symbol of the secondary display will only be available if the secondary_display_direct_access_string register at address 200 (see Table 23 Page 37) is not empty.	$\checkmark$
XX:XX	secondary_display	The secondary display is used to show time, date and/or a short text depending on the semantic meaning of a display value or set point. It can also be directly accessed via the Modbus register: secondary_display_direct_access_string (see Table 23 on Page 37).	~
am pm	am_pm_symbols	These symbols are not directly accessible but are shown along with the time when 12h time format has been selected.	-
*	cool	Cooling symbol	$\checkmark$
Ŵ	man_out	Man outside the house (no occupancy)	$\checkmark$
<b>•</b>	man_in	Man inside the house (occupancy)	$\checkmark$
<b>i</b> +	arrow	Arrow symbol (to represent a set point)	$\checkmark$
+	temp_in	Temperature inside	$\checkmark$
	temp_out	Tempareture outside	$\checkmark$
	house	House symbol	$\checkmark$
ADDR CAL RGB OFFLINE	text_symbols	The text symbols are not accessible via Modbus but are shown at certain modes or events.	-
Ĵ	key	The key symbol is primarily used to show that a set point is pincode protected but it can also be accessed via the symbol direct access registers.	$\checkmark$

10

Segment	Name	Description	Direct Access
CD)	wind	Wind alarm symbol	$\checkmark$
	rain	Rain alarm symbol	$\checkmark$
	window	Window open alarm symbol	$\checkmark$
	fan	Fan symbol	$\checkmark$
M	valve	Valve symbol	$\checkmark$
Ĺ	logo	Loytec logo symbol	$\checkmark$
	green_leaf_3		$\checkmark$
-	green_leaf_2	The green leaf symbols can be used to	$\checkmark$
Ĩ	green_leaf_1	display the level of eco-friendliness or to visualize environmental conditions.	$\checkmark$
	green_leaf_0		$\checkmark$
	bar_left_2		$\checkmark$
	bar_left_1		$\checkmark$
ľ	bar_left_0	The left bar graph symbols can be used to display a heating or cooling stage in automatic or manual mode.	$\checkmark$
MAN AUTO	manual_left		$\checkmark$
/ MAN AUTO	auto_left		$\checkmark$
	bar_right_2		$\checkmark$
	bar_right_1		$\checkmark$
	bar_right_0	The right bar graph symbols can be used to display a fan stage or valve position in automatic or manual mode.	$\checkmark$
MAN AUTO	manual_right		$\checkmark$
MAN V AUTO	auto_right		$\checkmark$

Segment	Name	Description	Direct Access
888.8	main_display	The main display is primarily used to show certain values. It is not accessible directly.	-
°F	unit_F		-
°C	unit_C		-
cfm	unit_cfm		-
l/s	unit_l/s		-
m³/h	unit_m³/h	All unit symbols are not directly accessible but are displayed along with a display value or set point if the unit is set	-
Pa	unit_Pa	in the corresponding configuration register. See Table 28 on Page 42 for display	-
inWC	unit_inWC	value configuration and Table 29 on Page 44 for set point configuration.	-

Table 3: LCD Segments Overview

# 2 What's New in L-STAT

### 2.1 New in L-STAT 1.4.0

This section describes the major changes and new features. For a full list of changes refer to the Readme file.

### Loading Factory Default Values in Device Settings Menu

Factory default values can now be loaded via the device settings menu. For further information see Section 3.2.5 on Page 21.

### 2.2 New in L-STAT 1.2.3

This section describes the major changes and new features. For a full list of changes refer to the Readme file.

### **Display Auto Shuffle Mode**

At the user\_interface\_settings register at address 183 (see Table 20 on Page 35) the DAS flag was added which activates the display auto shuffle mode, where each display value or set point is shown for 5 seconds within a cycle.

### 2.3 New in L-STAT 1.2.0

This section describes the major changes and new features. For a full list of changes refer to the Readme file.

### **Configuration Backup & Restore**

The new firmware supports the backup and restore of Modbus registers used for configuring the device. Please see Chapter 8 for further information.

#### Secondary\_display\_direct\_access\_string\_volatile Flag

An additional flag was added at the configuration flags register at address 192 (see Table 22 on Page 36) for setting the content of the secondary\_display\_direct\_access\_string register volatile.

### 2.4 New in L-STAT 1.1.0

This section describes the major changes and new features. For a full list of changes refer to the Readme file.

#### **Cleaning Function**

This is a special mode for cleaning the surface of the device where touch-buttons are disabled for a certain amount of time. Please see Section 3.2.2 for further information.

### **External Button Inputs support Switches**

With this firmware the external button inputs are supporting push-buttons and switches too.

# **3 Quick-Start Guide**

### 3.1 Hardware Installation

Please refer to the L-STAT installation sheet for further information on dimensions, mounting and wiring.

Figure 2 shows the back view of the device with the connection terminals for Modbus, 24 V DC-Supply and external buttons. The four external buttons share a common GND connection which is internally connected to the negative 24 V input terminal.

The external button terminal EB3 is also capable of sensing a NTC-10k temperature sensor. The temperature value of the sensor will be provided on Modbus register address 49 (see Table 10 on Page 27). The cable length for connecting the temperature sensor must not exceed 150m for 0.5mm<sup>2</sup> or 70m for 0.25mm<sup>2</sup> to guarantee a temperature error less than 0.1% at  $25^{\circ}$ C.

Figure 2: Back View LSTAT-80x-Gx-Lx

### 3.2 User Interface

### 3.2.1 General Description

The user interface consists of the LCD for displaying any desired value and up to eight touch buttons which are used to adjust set points and change settings. Additionally up to four external push-buttons can be connected to the device.

Figure 3: Front View LSTAT-80x-Gx-Lx

Each button can be configured individually via a Modbus register for its function (see Table 24 on Page 38). The following listing gives you an overview which functionality can be associated with the buttons.

change set point or device setting in EDIT-mode directly access a set point in DISPLAY-mode

no specific function, the button state can be requested to control lighting

no specific function, the button state can be requested to set occupancy state

short press <3s: cycle through display values, set points or device settings

long press ~3s: switch between DISPLAY-mode and EDIT-mode long press >6s: switch to CLEANING-mode

### 3.2.2 Operating Modes

In Figure 4 the operating modes of L-STAT are depicted. Each operating mode gives access to certain Modbus registers that can either be viewed or edited depending on the mode. The following data is available on L-STAT:

- display values: Are used to visualize data provided by the Modbus master or values of internal sensors. It is viewed in DISPLAY-mode. For the display value registers see Table 11 on Page 28 and Table 28 on Page 42 for the corresponding display value configuration.
- set points: Are used to visualize data that is provided by the Modbus master and that can be edited by the user. It is shown in DISPLAY-mode and it can be edited in EDIT-mode. For the set point registers see Table 32 on Page 48 and Table 29 on Page 44 for set point configuration. The range in which a set point can be altered is defined by minimum and maximum values that have to be written by the Modbus master. Please refer to Table 33 on Page 49 and Table 34 on Page 50.
- device settings: These values define some basic settings of the device itself. Please refer to Table 5 on Page 20 for a listing of all device settings and to Table 18, Table 19 and Table 20 on Page 33 f. for the corresponding Modbus registers. Device Settings can only be edited by the system administrator in EDIT-mode.
- offset values: Are used to add a certain offset to a display value. This functionality can be used to calibrate sensor values. Offset values can be edited by the system administrator in CALIBRATION-mode directly at the device or over Modbus. Please see Table 35 on Page 51 for the offset value register.

Figure 4: Operating Modes of L-STAT

When the device powers up, it enters DISPLAY-mode and it will display the first display value. When pressing the MENU-button the next value will be shown. First all active display values and then all active set points are displayed. After the last set point, the display will show the first display value again.

EDIT-mode is entered by pressing the MENU-button for more than 3 seconds. To enter EDIT-mode as system administrator two additionally defined buttons (TB0 and TB4) need to be pressed along with the MENU-button for more than 3 seconds. Also in EDIT-Mode a short press on the MENU-button is used to go to the next value. Any other button that has no specific function can be used in EDIT-mode to cycle the values in the opposite direction. EDIT-mode is left when pressing the MENU-button for more than 3 second.

The system administrator will also be able to view and edit the device settings.

CALIBRATION-mode will be entered for any display value when pressing one UP- and one DOWN-button simultaneously for more than 3 seconds to adjust the offset. This mode is secured by the system administrator password. CALIBRATION-mode is left when pressing the MENU-button for more than 3 second or after a timeout of 1 minute.

An overview of all possible operating modes is given in Table 4 below. The operating mode can also be defined by the Modbus master by writing the user interface direct access register (see Table 13 on Page 29).

Order of L-STAT Operating Modes	Description
0 DISPLAY-mode / display values	Display values are shown.
1 DISPLAY-mode / set points	Set points are shown.
2 EDIT-mode / set points	Set points can be edited.
3 EDIT-mode / device settings	Device settings can be edited. This mode is only accessible for the system admi- nistrator.
4 CALIBRATION-mode / offset values	Offset values can be edited
5 PINCODE-ENTRY / end user	The pincode for the end user has to be entered to show and/or edit the requested value.
6 PINCODE-ENTRY / system administrator	The pincode for the system administator has to be entered to show and/or edit the requested value.
7 DIRECT_ACCESS-mode / set points	A defined set point can be accessed and edited without entering EDIT-mode. It can be entered by pressing a defined button (see Table 24 on Page 38). In contrast to EDIT-mode only predefined set points can be edited. The DIRECT_ACCESS-mode can be left by pressing any button that has no direct access capability.
10 CLEANING-mode	This mode is used to clean the surface of the device without any response of the touch buttons and hence any unwanted changes. This mode is entered by pressing the MENU-button for at least 6 seconds. After 10 seconds with no interaction the device will switch back to DISPLAY-mode automatically.

Table 4: Operating Modes

UP-, DOWN-button:

These buttons are used to change the pincode value.

### 3.2.3 Access Levels

The L-STAT has two access levels (end user & system administrator) with configurable rights to display and edit values. Each access level is secured by a four digit pincode that will be requested if EDIT-mode or DIRECT\_ACCESS-mode is entered and the desired value is pincode protected.

Per default the pincode for end user and system administrator access level is disabled (0000). Otherwise the pincode can be entered as described in Figure 5.

Figure 5: Pincode Entry

### 3.2.4 Device Settings

The following Table gives an overview of the device settings accessible through the button interface as well as via Modbus. For the corresponding Modbus registers please refere to Table 18, Table 19 and Table 20 on Page 33 and following.

Device Setting	Possible Values	Default	Your Setting
Modbus Parity	Odd / Even / None	None	
Modbus Baudrate	1.2kB / 2.4kB / 4.8kB / 9.6kB / 19.2kB / 38.4kB / 57.6kB / 115.2kB	57,6kB	
Modbus Address	1 - 247	1	
Pincode System Administrator	0000 – 9999 (if 0000 the pincode is disabled)	0000	
Pincode End User	0000 – 9999 (if 0000 the pincode is disabled)	0000	
Color Setting LCD Backlight Red	0% - 100%	100%	
Color Setting LCD Backlight Green	0% - 100%	100%	
Color Setting LCD Backlight Blue	0% - 100%	100%	
Brightness LCD Backlight	0% - 100%	100%	
LCD Contrast	0% - 100%	100%	
LCD Color Scheme	0 – user (as defined above) 1 – white 2 – red 3 – green 4 – blue 5 – orange 6 – magenta 7 – cyan	0	
Time Format	24h / 12h	24h	
Show Date	on / off	off	
Show Time	on / off	off	
Acoustic Feedback (for Touch Buttons)	on / off	on	
Goto First Display Value (the first display value will be displayed after 1 minute without inter- action)	on / off	on	
Display Auto Shuffle	on / off	off	
Display Auto Dim (lcd brightness will be dimmed after 2 minutes with no interaction)	off / 50% / 10% / 0% / OCC* * built-in occupancy sensor activates display	off	
Unit System	SI / US	SI	
Device Restart	off – if a DOWN-button is pressed the device will be rebooted manually	-	
Load Factory Defaults	see Section 3.2.5 on Page 21	-	

Table 5: Device Settings

### 3.2.5 Factory Default

The factory default configuration for display values and set points depends on the specific L-STAT model. The following Table shows the factory default values for each model. See Table 28 on Page 42 for display value configuration and Table 29 on Page 44 for set point configuration.

	LSTAT-800-Gx-Lx	LSTAT-801-Gx-Lx	LSTAT-802-Gx-Lx
display_value_0	Internal Temperature	Internal Temperature	Internal Temperature
display_value_1	Relative Humidity	Relative Humidity	Relative Humidity
display_value_2	Dew Point	Dew Point	Dew Point
display_value_3	-	-	CO <sub>2</sub> Level
display_value_4	Modbus Voltage	Modbus Voltage	Modbus Voltage
display_value_5	External Temperature	External Temperature	External Temperature
display_value_6 to display_value_15	-	-	-
set_point_0	Internal Temperature Set Point	Internal Temperature Set Point	Internal Temperature Set Point
set_point_1	Fan Stage	Fan Stage	Fan Stage
set_point_2 to set_point_15	-	-	-

Table 6: Factory Default for L-STAT Models

The factory default values can be loaded manually via the device settings menu. The function is located at the last position of the menu. The secondary display will show which button has to be pressed as depicted in Figure 6. After all buttons have been pressed in the right order the factory defaults will be loaded. Therefore the device will reboot. By pressing the MENU button instead of UP or DOWN during the sequence the process can be aborted.

Figure 6: Loading the factory default values

### **3.3 Getting Started with the Configurator**

A Modbus Template for the L-INX configurator with all available datapoints can be downloaded from the Libraries/Templates Download section on the LOYTEC website: <a href="https://www.loytec.com/support/download">https://www.loytec.com/support/download</a>

For further information on using the L-INX configurator for Modbus devices please refer to the L-INX Configurator User Manual [1].

Please refer to Chapter 4 for a listing of all available Modbus Registers.

# 4 Modbus

### 4.1 Introduction

The L-STAT operates as a Modbus slave in Modbus RTU mode. The default baudrate is set to 57600, the default parity is set to 'none' and the default address is set to 1. The communication with a Modbus master device will work with Modbus function code 0x03 (Read Holding Registers) and Modbus function code 0x06 (Preset Single Register). Section 4.4 shows all available Modbus registers.

### 4.2 Modbus Network

Figure 7 illustrates a typical Modbus network setup with a linear bus topology used to connect several slave devices to a master device. The transmission line has to be terminated at both ends. At the master device this can be done by connecting an L-Term (LT-04) device. Each L-STAT slave device is equipped with a built-in  $120\Omega$  termination resistor. Set the termination switch to OFF except on the last device on the bus where the termination switch must be turned ON. Per default each device has the Modbus address set to 1. Because each address can only be used once it has to be configured at the device settings in EDIT-mode. For further information please see Section 3.2.

Figure 7: Modbus Network

### 4.3 Modbus Register Usage for Value Display

The following Figure 8 shows, which Modbus registers have influence on a displayed value, unit, text on the secondary display or symbols. Depending on settings in configuration registers different combinations are possible to achieve the desired result.

Figure 8: Modbus Register Usage for Value Display

### 4.4 Modbus Register Description

In the following sections the L-STAT Modbus registers are described. Abbrevations are explained at the end of each table. 'R' indicates that this value is not used by now and that it is reserved for future use. Square brackets '[]' indicate that this is the initial value. Numbers with the prefix '0x' are hexadecimal values. Values with no prefix indicate decimal values.

### 4.4.1 Data Registers

These registers contain data that is changing frequently. This data is not stored persistent in the L-STAT device and will be lost after a reboot.

Register Name	Register

command	0x0020	[0x00] [0x00]									
	-	This register provides the button_code and remote_id of a valid command received via the infrared receiver. See Chapter 6 for detailed information.									
	<ul> <li>Whenever a command was received the ir_remote_control_command register is updated and the IRC flag of the short_pressed register at address 1 is set (see Table 7 on Page 26).</li> </ul>										

#### Table 9: IR Remote Control Command

The following Table gives an overview of the internal sensor values. These registers can be read over Modbus and can be used as source for a display value if configured. As described in Section 3.2.2 on Page 17 there are up to 16 display values used to visualize data. Each display value has two 16 bit configuration registers to specify the values displayed. Display values (register address 64 to 79) are read- and writable over Modbus.

① A sensor value can be used as source for a display value. Therefor the DSSA or DSEU bit as well as the semantic meaning at the corresponding display value configuration at address 256 to 286 has to be set (see Table 28 on Page 42). If the DSSA or DSEU bit is set this specifies that a sensor value is used instead of a display value. The semantic meaning specifies which sensor value is used as source for displaying. For an overview on this topic please see Figure 8 on Page 24.

① Sensor\_value\_0, sensor\_value\_1 and sensor\_value\_3 are 16 Bit signed values. All other sensor values are defined as 16 Bit unsigned since there are no negative values to expect. The values are scaled as described in Table 39 at Page 56.

Table 10: Sensor Values

If an external temperature sensor is connected to the EB3 terminal and GND the value of this sensor will be provided as sensor\_value\_1. It is advised but not necessarily required to disable the button function at the button configuration register at address 227 (Table 25 at Page 39) when used as temperature sensor input.

		<b>ime_cleared_0</b> and <b>modbus_time_cleared_1</b> represent a 32 bit timestamp in nce JAN-01-1970 that is set by the L-STAT device after the statistics have been													

that is set by the L-STAT device after the statis cleared by the master device.

All other values are 32 bit counters incremented by the L-STAT device. These values are not permanently stored at the L-STAT and will be lost after a reboot.

 The statistics can be cleared by setting the MSC bit at the config\_flags register at address 192 (see Table 22 on Page 36).

Table 17: Modbus Statistics

32

### 4.4.2 Device Settings

The device settings contain data to configure the device and the user interface. This registers are also accessible through the button interface in EDIT-mode for the system administrator. The data is stored persistently and will be preserved during power loss.

Register Name	Register Address	15	Bit Position           15         14         13         12         11         10         9         8         7         6         5         4         3         2         1												0

	<b>occupancy_timeout:</b> defines a timeout in seconds when the state of the occupancy flag of the short pressed register at address 1 will be cleared again after motion was detected. Anyway the occupancy flag of the present state register at address 0 will show the actual state of the occupancy sensor without occupancy timeout. Please see Figure 9 for further information on operation.										in ne						
EN: occupancy sensor enabled, only if enabled the occupancy flag of the present state and short pressed register at address 0 and 1, Table 7 on Page 26 will be set.																	
① Applies only to LSTAT-801-Gx-Lx and LSTAT-802-Gx-Lx.																	

Table 20: User Interface Settings

Table 21: Occupancy Sensor Configuration

As depicted in Figure 9 the occupancy flag is set when motion is detected and will be cleared again after the occupancy\_timeout has exceeded as defined at the occupancy\_sensor\_configuration register.

Figure 9: Occupancy Sensor Operation

### 4.4.3 Configuration Registers

The configuration registers contain data for configuring fundamental functions of the device as well as configurations for display values and set points. The data is stored persistent and will be preserved after reboot.

Pagistar Nama	Register	Bit Position										
Register Name	Address	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0										
config_flags	192 0x00C0	R         SDSV         MSC         IRCP         DU         MU         VIE         VOL         AIE         AOL         PESA         PEEU         SDE         RST           [0]         [0]         [0]         [0]         [0]         [0]         [0]         [1]         [0]         [1]         [0]         [1]         [1]         [0]         [0]         [0]         [1]         [1]         [1]         [0]         [0]         [0]         [0]         [1]         [1]         [1]         [1]         [0]         [0]         [0]         [1]         [1]         [1]         [1]         [0]         [0]         [0]         [1]										
	RST:	reset_device flag, set to '1' the device will reboot										
	SDE:	secondary_display_direct_access_enabled flag, set to '1' the device displays the content of the secondary_display_direct_access_string register at address 200 (see Table 23 on Page 37)										
	PEEU:	<b>EEU:</b> pincode_enabled_for_end_user flag, if set to '1' the pincode for the end user can be edited by the end user										
	PESA:	pincode_enabled_for_system_administrator flag, if set to '1' the pincode for the end user and the system administrator can be edited by the system administrator										
	AOL:	acoustic_alarm_when_offline flag, if set to '1' a buzzer tone will be generated while the device is offline										
	AIE:	acoustic_alarm_on_internal_error flag, if set to '1' a buzzer tone will be generated if an internal error occurred										
	VOL:	visual_alarm_when_offline flag, if set to '1' the offline text symbol ( OFFLINE ) will be displayed while the device is offline										
	VIE:	visual_alarm_on_internal_error flag, if set to '1' the alarm symbol ( $\triangle$ ) will be displayed if an internal error occurred										
	MU:	modbus_unit, defines which unit system is used for values on Modbus. The following values are possible: 0x0 - K 0x1 - °C (SI) 0x2 - °F (US)										
	DU:	display_unit, defines which unit system is used to display values on the L-STAT. The following values are possible: 0x0 - access prohibited via the user interface 0x1 - °C (SI) 0x2 - °F (US)										
		The display_unit can also be changed via the user interface in the device settings (see Table 5 an Page 20). If the value is set to ' $00$ ' the access to this device setting via the user interface is prohibited.										
	IRCP:	ir_remote_control_pairing flag, for further information see Section 6.2										
	MSC:	modbus_statistics_clear flag, for further information see Table 17 on Page 32										
	SDSV:	secondary_display_direct_access_string_volatile flag, if set to '1' the content of secondary_display_direct_access_string (Table 23 on Page 37) is not kept persistent. This should be considered when the content of this register is changed frequently because of the limited write cycles of persistent memory.										

Table 22: Configuration Flags

Please note that a change of display\_unit or modbus\_unit at the config\_flags register will change the configuration registers for display values at address 256 to 289 and set points at address 320 to 351 to match the selected units system. Please see Table 28 on Page 42 for display value configuration and Table 29 on Page 44 for set point configuration.

If the direct value registers at adderss 104 and 105 (see Table 15 on Page 31) are used to display certain values there is no need to set the SDE flag at the config\_flags register (see Table 22 on Page 36) to show a text along with the value. If the direct value enable bit is set to '1' the content of sec\_display\_direct\_access\_string will be checked by the device. If the string is empty time and/or date will be displayed if enabled at user\_interface\_settings at addresse 183 (Table 20 on Page 35). Otherwise the content of the string will be displayed automatically. If it is desired to don't show anything at the secondary display a space character (0x20) needs to be inserted.

Table 30 below shows possible values for the semantic meaning used in the configuration for display values (Table 28 on Page 42) and set points (Table 29 on Page 44). Primarily the semantic meaning field defines a text that is displayed along with a display value or a set point. Additionally for display values it defines the internal sensor\_value that is displayed when the DSEU or DSSA bit is set. For examples on how to use the semantic meaning field in the configuration registers please see Table 31 on Page 46.

Semantic Meaning Value	Description	Secondary Display Text
0x00	None (unconfigured)	
0x01	Internal Temperature abs.	ROOM
0x02	Internal Temperature rel.	ΔSPT
0x03	External Temperature	OUT
0x04	Relative Humidity	НИМ
0x05	Dew Point	D E W
0x06	Luminance (lx)	LUX
0x07	Amount CO <sub>2</sub>	C O 2
0x08	Differential Pressure	P R E S
0x09	Flow	FLOW
0x0A	Valve Position	VALV
0x0B	Fan Stage	FAN
0x0C	Heat/Cool Stage	H & C
0x0D	Brightness (%)	B R %
0x0E	Supply Voltage	2 4 V
0x0F	CPU voltage	CPU
0x10	CPU temperature	CPU
0x11	Room ID	R O O M
0x12	Damper Position (%)	D A M P
0x13	Reheat (%)	H E A T
0x14	Discharge Temperature	DIS

Table 36: Model Information Registers

#### 4.4.5 Device Information Registers (read only)

The registers shown in Table 37 are set at production and contain specific information about the device.

Description	Register Address	Bit Position										
	Address	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0										
product_code_string	560 0x0230 -	product_code_string										
	569 0x0239											
serial_number_ string	576 0x0240 - 585 0x0249	serial_number_string										
firmware_version_ string	592 0x0250 - 595 0x0253	firmware_version_string										
<i>6</i> :	596 0x0254	firmware_date_0										
firmware_date	597 0x0255 firmware_date_1											
bootloader_version_ string	608 0x0260 - 611 0x0263	bootloader_version_string										
haatlaadan data	612 0x0264	bootloader_date_0										
bootloader_date	613 0x0265	bootloader_date_1										
(i) firmware_date_0 and firmware_date_1 as well as bootloader_date_0 and bootloader_date_1 represent a 32 bit timestamp in seconds since JAN-01-1970 indicating the build time.												

Table 37: Device Information Registers

Version 1.4

#### 4.4.6 NFC Registers

These registers provide an URL that can be accessed by NFC enabled devices such as smart phones to get additional information and control of the room automation.

Description	Register																
1	Address	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	1024																
	0x0400																
url_string	-	[http://www.loytec.com]															
	1148																
	0x047C																
<ul> <li>① Up to 248 ASCII character including a string terminator (0x00) can be used. The string will be converted to a NDEF URI record that is saved on the NFC tag. For further information on the NFC interface see Chapter 5.</li> </ul>																	

Table 38: NFC Registers

#### 4.4.7 Value Scaling and Stepwidth

The following Table 39 gives an overview of how Modbus register datapoints (display values, set points, min., max. and offset values) need to be scaled to achieve the desired result at the L-STAT display. It also shows which stepwidth is defined for set points.

Physical Value	Unit		dbus Sc ^B*(ray		Set Point Stepwidth	Example				
Thysteat Value	Cint	Α	B	C		raw value	displayed value			
No Unit	-	1	0	0	1	100	100.0			
	(K)	1	-1	-2740	0,5	2975	□ <b>23</b> .5 <sup>℃</sup>			
<b>Τ</b>	°C	1	-1	0	0,5	235	□ <b>23</b> .5 <sup>℃</sup>			
Temperature	°F	1	-1	0	1,0	743	0 <b>74</b> .0 <sup>°F</sup>			
	°F dec.	1	-1	0	0,5	743	074.5 °F			
	m³/h	1	0	0	1	150	150.0 <sup>m³/h</sup>			
Flow	1/s	1	-1	0	0,1	417	041.7 <sup>1/s</sup>			
	cfm	1	0	0	1	88	88.0 <sup>cfm</sup>			
D	Pa	1	0	0	1	200	200.0 <sup>Pa</sup>			
Pressure	inWC	1	-3	0	0,01	803	0.803 <sup>inWC</sup>			
Voltage	V	1	-1	0	0,1	240	024.0 <sup>v</sup>			
Percentage	%	5	-3	0	1	9000	045.0 <sup>%</sup>			
Humidity	%RH	5	-3	0	1	9000	045.0 <sup>%RH</sup>			
Amount CO <sub>2</sub>	ppm	1	0	0	1	550	550.0 <sup>ppm</sup>			
	unsigne	d or -32	2768 to	32767 i	lue or a set point wo f signed the value that ligit display.					

- (1) When a fixed-point number reaches a certain limit where an overflow occurs the decimal point is shifted rightwards (e.g.  $999.9 \rightarrow 1000$ ).
- (1) Whole number values are preferably displayed with the bigger digits. If an overflow occurs the number is shifted rightwards (e.g.  $999 \rightarrow 1000$ ).

Table 39: Value Scaling and Stepwidth

## 5 NFC

### 5.1 General Description

The NFC interface of the L-STAT device can be used to get additional information and configuration options for room automation. The L-STAT will behave like an NFC tag that can be read by an NFC enabled device. The antenna is located behind the LCD and best performance is achieved by putting the NFC enabled device right on the front panel glass. Depending on where the antenna of the mobile device is located the optimal position will be found by moving the device slowly over the front panel. Best performance can be achieved by positioning the device in a more or less horizontal position covering the LCD as shown in Figure 10.

Figure 10: NFC Device Positioning

If the connection is established the NFC field detection bit at the short\_pressed Modbus register at address 1 (Table 7 at Page 26) will be set. In the meantime the NFC enabled device will read the memory of the tag and will perform an appropriate action. Since a NDEF URI record is saved at the tags memory (Table 38 at Page 55) the device will ask to open the defined URL in the browser of the NFC enabled device.

### 5.2 Copy the L-WEB Project URL to the NFC Tag Memory

To show an L-WEB project on your mobile device by NFC, simply copy and paste the URL of the L-Web project to the url\_string of Table 38. Note that the mobile device needs network or internet access to open the URL. Please follow the instructions below.

#### To Copy a L-WEB Project URL to the NFC Tag Memory

- 1. Open the web interface of your device
- 2. Select **Project List** from the **L-WEB** menu.
- 3. Open the desired project in the web browser as shown in Figure 11.

Figure 11: L-WEB Project List

- 4. Simply copy the URL of the desired project from the browsers address bar and go to the **Modbus Datapoints** of the L-STAT device.
- 5. Open the **nfc\_string** datapoint in the web interface of your device and paste the L-WEB project URL at the **Value** field as shown in Figure 12.
- 6. Click on the **Set** button to save the string.

Figure 12: L-STAT NFC String

### **6 IR-Remote Control Operation**

#### 6.1 General Description

The IR receiver is located behind the front panel glass above the LCD. The L-STAT device implements the NEC IR protocol compatible with the Apple remote control as displayed in Figure 13.

Figure 13: Apple Remote Control

Whenever a command gets received the IRC bit at the short\_pressed Modbus register at address 1 (Table 7 at Page 26) is set. The received button code as well as the remote ID can be read from the ir\_remote\_control\_command register at address 32 (Table 9 at Page 27).

Button Number	Description	Button Code
1	Center	46
2	Up	5
3	Left	4
4	Right	3
5	Down	6
6	Menu	1
7	Play/Pause	47

Table 40: Apple Remote Button Codes

Each remote control has an ID that is transmitted along with the button code. This ID can be used to pair a certain remote control with a certain L-STAT device. The ID of the Apple remote control can be changed by pressing Menu and Center button for at least 6s. This will increment the ID by one.

The ID of your remote control can be checked by pressing any button and watching the ir\_remote\_control\_command register in the Web interface as shown in Figure 14 below. This example shows that the Menu button was pressed on a remote control with the ID 14.

ROOT (ROOT OBJECT)	ROOT Modbus Port RS485	<b>ROOT</b> Modbus Port RS485 Datapoints							
System Registers	🗉 🗖 Name	Dir.	Туре	State	Value				
🛅 IEC61131 Variables	present_state	input	user	normal	00010000000000000

	sensor value 1	input	analog	normal	-10.9 °C				
	sensor value 2	input	analog	normal	33.46 % rel.hum.				

Figure 14: IR Remote Control Command Register

If an L-STAT device gets paired with a certain remote control it will only update the ir\_remote\_control\_command register and the IRC bit at the short\_pressed register when receiving a command from this remote control.

Pairing can be achieved by pressing Menu and Right button at the remote control for at least 6s while pointing towards the L-STAT device. If pairing worked the secondary display will shortly show ' $\mathbb{RP}$ ' (IR pairing). The remote ID will be saved internally and the IRCP flag of the config\_flags register at address 192 (Table 22 at Page 36) will be set.

The pairing can be canceled by either clearing the IRCP flag or by pressing Menu and Left button for at least 6s. If the secondary display shows ' $\mathbb{RUP}$ ' (IR unpairing) shortly the pairing is suspended.

### **7 Firmware Update**

#### 7.1 Firmware Update via the Web Interface

The current firmware can be downloaded from the Software Download section on the LOYTEC website: <u>https://www.loytec.com/support/download</u>

For the firmware update go to the web interface of the L-INX, L-ROC, L-IOB device.

#### To Update the Firmware via the Web Interface

- 1. Select Modbus under the Commission menu.
- 2. A listing of available devices will be displayed. Select the devices for the firmware update by clicking the check box on the right.
- 3. Select **Update firmware...** from the drop-down menu as shown in Figure 15 and click the **Select file...** button.

Figure 15: Web Interface – Modbus Commission

- 4. A File-Dialog window will pop up. Select the firmware file and click **Open**.
- 5. The selected devices will then receive the firmware updated.

### 7.2 Restoring Default Modbus Settings in Bootloader

If something went wrong during the firmware update the device keeps waiting in bootloader until a complete firmware image was received over Modbus. If also the Modbus settings got lost a procedure has been implemented in bootloader version 1.2.2 to restore the default Modbus settings: Parity = None, Baudrate = 57,6kB, Address = 1

#### To Restore the Default Modbus Settings in Bootloader

- 1. Unplug the power supply of the device.
- 2. Install a cable bridge between EB2 and EB3 as shown in Figure 16 below.

Figure 16: Cable Bridge EB2–EB3

- 3. Plug in the power supply again.
- 4. A red clock symbol will be displayed:  $\bigcirc$
- 5. If the cable bridge between EB2 and EB3 gets removed within 10 seconds from now on, the default Modbus settings will be restored. Otherwise the device will try to boot up as usual after the timeout has expired.

## 8 Configuration Backup & Restore

### 8.1 Configuration Backup & Restore via the Web Interface

For further information on configuration backup and restore via the web interface please refer to the LOYTEC Device User Manual [2].

## 9 Troubleshooting

#### 9.1 Technical Support

LOYTEC offers free telephone and e-mail support for the L-STAT product series. If none of the above descriptions solves your specific problem please contact us at the following address:

LOYTEC electronics GmbH Blumengasse 35 A-1170 Vienna Austria / Europe

e-mail :	support@loytec.com

## **10 Specifications**

### **10.1 Physical Specifications**

Operating Voltage	24 VDC ±10 %
Power Consumption	see Table 41
In rush current	up to 4A @ 24 VDC
Operating Temperature (ambient)	$0^{\circ}$ C to $+50^{\circ}$ C
Storage Temperature	$-10^{\circ}$ C to $+60^{\circ}$ C
Humidity (non condensing) operating	10 to 90 % RH @ 50°C
Humidity (non condensing) storage	10 to 90 % RH @ 50°C
LCD Backlight Lifetime	50,000 hours
Enclosure	94.5 x 110 x 19.5 (W x H x D)
Environmental Protection	IP 30 (enclosure)
Installation	Europe: switch box Ø 60mm US: switch box 4" x 2"

LCD brightness	LSTAT-800-Gx-Lx & LSTAT-801-Gx-Lx	LSTAT-802-Gx-Lx				
100%	0.8W	0.93W avg., 1.8W max.				
0%	0.09W	0.22W avg., 1.1W max.				

Table 41: Power Consumption

Following Table 42 should provide support for dimensioning of an installation and the power supply. For each device type there is a listing for up to 16 devices of the maximum possible cable length and the resulting power loss on the cable for different supply voltage levels. Together with the power consumption of the devices one can calculate the required power of the power supply.

Conditions of the Installation			Number of Devices

### **10.2 Sensor Specifications**

Ambient Temperature Sensor	type: CMOS range: $-40 - 125$ °C resolution: 0.1 °C accuracy: $\pm 0.5$ °C (5 - 60 °C)
Relative Humidity Sensor	type: capacitive range: 0 – 100 %R.H. resolution: 0.1 %R.H. accuracy: ±2 %R.H. @ 25 °C, 20 – 80 %R.H. ±3 %R.H. @ 25 °C, 0 – 20 %R.H. & 80 – 100 %R.H.
CO <sub>2</sub> Sensor	type: NDIR range: $0 - 2000 \text{ ppm}$ resolution: 1 ppm accuracy: $\pm 30 \text{ ppm}$ or $\pm 3 \%$ of reading warm up time: $< 2 \min (\text{operational}),$ $10 \min (\text{max. accuracy})$ self calibration: The sensor will perform a self calibration routine within the first 24 hours of continuous operation. After calibration has finished the sensor will operate at the defined accuracy. The sensor also remembers the lowest CO <sub>2</sub> levels of the last 14 days to compensate gradual sensor drift. Therefor it has to be guaranteed that CO <sub>2</sub> concentration regularly drops to outside background levels. Usually this takes place when a building is unoccupied for 4 to 8 hours a day.
Occupancy Sensor	max. range: 5 m detection zones: 64 opening angle: 94° H, 82° V (see Figure 17) temperature difference to background: 4°C

# **12 Revision History**

Date	Version	Author	Description
2015-12-09	1.0	HG	Initial Manual Version
2016-02-25	1.1	HG	Added comment for cleaning mode at MENU-Button description, revised description of 3.2.2 Operating Modes, extended description at 4.1 Introduction, revised Figure 7, changed size of Figure 8, changed layout of Table 36, added Table 42 and description for cable length and power supply dimensioning, extended description of $CO_2$ sensor self calibration algorythmus, correction of typing errors
2016-05-25	1.2	HG	"What's new" Chapter added, "Configuration Backup & Restore" Chapter added, Minor mistakes corrected, description for temperature sensor on EB3 added at Section 3.1, Table 4 reworked, Figure 5 and description added Section 3.2.3, description for external temperature sensor added below Table 10, Table 12, Table 13 and Table 20 reworked, occupancy_timeout description corrected at Table 21, SDSV flag added and descriptions revised at Table 22, descriptions added at Section 4.4.3, Table 23 info text reworked, pictures added at Table 36, description for Table 39 modified, updated Figure 15
2016-10-31	1.3	HG	Description at DIRECT_ACCESS-mode added at Table 4, Display Auto Shuffle added at Table 5, description of Table 7 modified, change flag for display_unit added at Table 8, DAS flag and description added at Table 20, "°F dec." unit added at Table 28 and Table 29, text modified at Page 45, example configuration for fan stage set point added at Table 31, light_up and light_down default print added at Table 36, "°F dec." unit added at Table 39, added Section 7.2
2017-01-18	1.4	HG	Description for new feature (loading factory default values) added at Section 3.2.4 and 3.2.5
