

Product bulletin for:

The BV10000

Tight sealing 2-way wafer butterfly valve

BV10000 in conjunction with the S70M electric actuator

Developed for HVAC applications

Energy, the right amount to the right place at the right time

Product bulletin issue date: 1214

Bray Armaturen & Antriebe Europa
Commercial Division

This product bulletin contains the following:

- **A list of features**
- **A valve cross-sectional view**
- **Ordering codes for valves**
- **Ordering codes for valve actuators**
- **A description of application**
- **A valve selection table**
- **Flow characteristic graphs**
- **Specification tables**

2 Introduction

2.1 Your benefits for greater energy efficiency

- Intelligent seat and disc design for function at the lowest possible torque.
Reduced torque extends life time and minimizes actuator size.
- The nylon-11 butterfly valve disc coating reduces loss that is due to friction and reduces costs of additional material variants for salt-water, well-water etc.
- Low Δp for reduced pumping cost.
- Tolerant of moderate levels of contamination in the fluid.
Lighter, more compact (short face-to-face) and thus less material needed for system construction than in globe valves.

2.2 Application

This shut-off and regulating equipment is specially designed and tailored to the needs of the HVAC market and finds use in the following areas:

- Cold and hot water applications.
- Water with a 50% max. glycol (water quality as per VDI 2035).
- Open water circuits such as:
 - Well water
 - Salt water
- The in-line BV10000 standard delivery is with wafer valves. However, lugged valves are available on request.

2.2.1 Properties

- Body: 16 bar nominal pressure.
- The GG25 JL1040 (cast iron) housing is protected from corrosion by a polyester coating.
- A secured and continuous shaft with acetal bearing journal and U – formed seal.
- Fits to PN6 (DN25 up to DN400), PN10, and PN16 flanges.
- Nominal sizes from DN25 to DN500. Larger sizes available on request.
- Valve disc bubble tight up to 10/12bar.
- For systems where low close-off pressures are necessary we recommend you use the BV11000. This valve model has a reduced-diameter butterfly-valve disc with a max. close-off pressure of 350 kPa (3.5 Bar), thus requiring lower unseating torque. This means that lower actuator torque is required so that smaller actuators can be used.
- Very low maintenance.

- From size DN 100 an additional model with a torque-optimized valve disc, bubble tight up to 3.5bar for reduced unseating torque.
- K_{vs} values from 36 m³/h to 19212 m³/h are available.
- The flow characteristic is near equal percent up to 70° disc angle.
- Manually operated butterfly valves:
 - Manual lever operation up to DN 300
 - Manual operation with gearbox DN 50 to DN 500
- The Bray S70M motor drive also suitable for HVAC and industrial environment.
- Modified kits for damper actuators prepared.
- The fluid does not come into contact with the body.
- The fluid is in contact only with the valve disc and seat and secondary stem seal.

3 Technical description

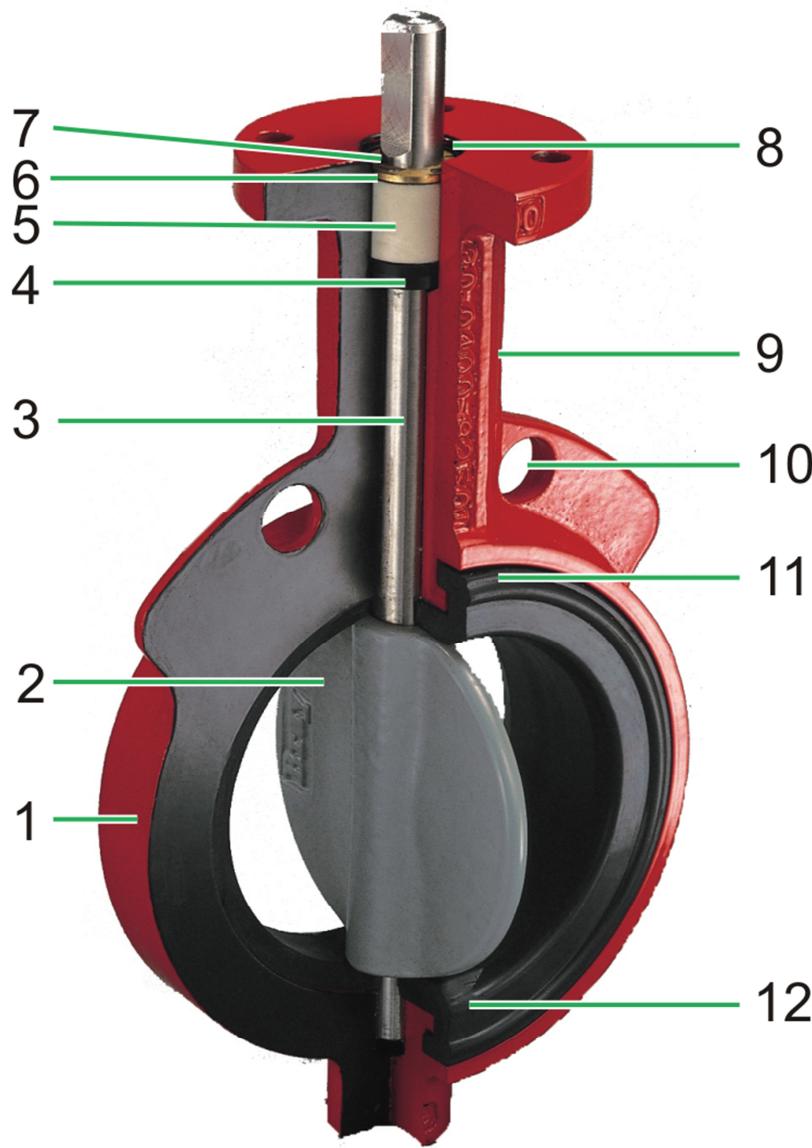

Fig. 1 BV10000 Sectioned

Bray's tongue and groove seat design (11 see Table 1 also) lowers torque and provides complete isolation of flowing media from the body. The seat also features a molded O-ring which eliminates the use of flange gaskets.

The wafer type valve body (1) is polyester coated for excellent corrosion resistance.

Primary and secondary seals (12). These seals prevent line media from coming in contact with the stem or body. Primary seal is achieved by an interference fit of the molded seat flat with the disc hub. Secondary seal is created because the stem diameter is greater than the diameter of the seat stem hole.

The valve disc (2) is coated with Nylon 11 thermoplastic material (a mineral based material). This ensures an excellent durability against corrosion. This is documented in a 2000 hour salt spray test and over a six year long continuous sea water test. No signs of corrosion were found.

Technical description

The surface is:

- Unsusceptible to impact and abrasion resistant (low friction coefficient).
- Resistant to ultra-violet radiation.
- Resistant to fungi

The valve neck (9) makes a simple insulation of the pipe and valve body possible. The flange fitting holes (10) simplify fitting and ensure proper centering in the pipe system.

Wafer butterfly valves for pre-welded flanges PN 6, PN 10 and PN 16

as per EN/DIN 1092-1/11/B1 – DN 25 to DN 400.

DN 450 to DN 500 – PN 10 and PN 16

Technical description

3.1 Manually operated positioning with lever and manual gearbox

Bray offers hand levers (DN25 to DN300) and manual operation with gearbox (DN50 to DN500) to manually operate and position the valve disc. The hand levers have a setting of 10 ratchet adjustments. The self-locking gears have a smooth operation

A sudden closing of the valve, through the system, is to be avoided (danger from water hammer).

BV10032/BV001M

BV10080/BV001G

3.2 Combination with the S70M electric actuator

Bray offers the S70M electric rotary actuator series for use with the BV10000 butterfly valve from size DN 50 for exact positioning and tight closing. The actuators are combined with controllers that have proportional and switchable 2-point and 3-point output for safe operation of the butterfly valve. The actuators feature the following:

- 24V AC and 230V AC 2-point, floating or modulating models
- Output torque from 68 Nm to 2034 Nm
- Hand wheel for manual operation always present
- 2 auxiliary switches as standard
- Clamp connection
- Direct fit to the BV10000 butterfly valve
- Optical position display
- Suitable for industrial environment (IP65)
- Very low maintenance
- Turning angle reduction through a positioning switch (preset at 90°) and intelligent turning angle adapter incl. adapted feedback signal
- Self-regulating heater to prevent condensation buildup within the actuator (optional)
- Adjustable positioning speed, corresponding to the in-situ application (modulation model)
- Response sensitivity adjustable in-situ (modulation model)

To order an already fitted combination simply add the module, for example
BV11150/S70M240060

You can also order with a built-in self-regulating heater that prevents condensation within the actuator. Just add an "H" to the actuator order No. for example: BV11150/S70M240060H

Technical description

3.2.1 Electrical OEM standard damper actuators with and without spring return.

Bray has prepared linkage-kits for standard electric damper actuators with and without spring return.

Dimension drawings come later in this document. Customized fittings are possible if required.

As a first point of reference use the table below to work out the required minimum torque that is determined by the momentary seating/unseating torque.

Please contact us for the possible combinations with your OEM actuators

*Valid for the application case A: Water temperature range 0° to 80°C. Valve must be cycled once weekly.

3.2.2 Function

The butterfly valve is used as a stop cock or a control valve.

Manual operation is possible through a hand lever or manual gearbox.

The S70 is available as an industrial standard direct-fit electric none spring return actuator. When using 3rd party standardized electric damper-actuators with and without spring return, Bray is ready to advise you.

3.2.3 Project planning and mounting instruction

The valve is bolted between two flanges. During fitting, the wafer butterfly valve must be opened in accordance with the mounting instructions.

The seat is so constructed that no additional seals or gaskets are necessary when the butterfly valve is fitted between the pipe flanges.

Flow can be Bi-directional.

3.2.4 Additional operational information

- Face-to-face dimensions in accordance with ISO 5752, EN 558 row 20 DIN 3202 Part 3 K1
- Parts in contact with fluids are the valve disc and seat.
- Actuator top flange in accordance with ISO 5211
- Fitted flange in accordance with EN 1092-2

3.2.4.1 Pressure Equipment Directive – PED

The valves are manufactured in accordance with conformity assessment procedure:

PED 97/23/EC

Category III. Module B1 EC design examination and module D, production quality assurance as approved by Lloyds (Notified body No. 0038) under EC certificate of conformity COV0512853/1

K_{vs}/flow diagram and flow characteristic diagrams

4 K_{vs}/flow diagram and flow characteristic diagrams

The following table and diagram give the flow volume (K_{vs} value) at a fully open valve and a Δp of 100kPa across the valve at a water temperature between 5°C and 30°C as well as varying differential pressures across the valve.

Note: During configuration the maximum flow speed of 4 m/s (water) is recommended with regard to, for example flow noise.

Kvs/flow diagram and flow characteristic diagrams

The BV10000 butterfly valve characteristic curve is a modified equal percent flow characteristic as per VDI 2176. At a disc angle of 70° the K_v value is 55% to 60% of the K_{vs} value. Recommended range for modulating control up to 70%.

The K_v readings give the water flow in m^3/h at temperatures between 5°C and 30°C and a pressure loss of 1 bar (100 kPa) at the corresponding orifice angle.

Please note that the recommended maximum water flow speed of 4 m/s and air flow speed of 54 m/s are not to be exceeded.
